SAMPLE REGISTRATION SYSTEM
STATISTICAL REPORT 2012

OFFICE OF THE REGISTRAR GENERAL, INDIA
MINISTRY OF HOME AFFAIRS
GOVERNMENT OF INDIA
NEW DELHI

P R E F A C E

The Sample Registration System (SRS) in India is the largest demographic survey in the world covering about 1.5 million households and 7.35 million population. It has continued to be the main source of information on fertility and mortality indicators both at the State and National levels. Apart from the large sample size and geographical spread in most of the Districts, the system has a unique feature of dual recording, which involves collection of data through two different procedures viz., continuous enumeration and retrospective half-yearly surveys. The continuous enumeration and retrospective surveys are followed by the process of matching of the two records and subsequent field verification of unmatched and partially matched events. The system provides a cross check on the correctness and completeness of the events of birth and death listed by the two independent functionaries.

2. Based on the dual record system, the SRS has been providing reliable estimates of fertility and mortality on a regular basis from 1971 onward. It includes data on population composition by broad age groups, sex and marital status, fertility and mortality levels, for India and bigger States (with population 10 million and above) separately for rural and urban areas. Tabulations on certain items of demographic interest such as mean age at effective marriage for females, interval between current and previous live birth and also distribution of live births by birth order have continued to form part of the SRS report. From 2000, the sex ratio at birth and from 2002, the sex ratio of child (age-group 0-4) have been included in this Report. Moreover, in order to facilitate effective tracking of Millennium Development Goals (MDGs) on under-five mortality, the estimates of under-five mortality for India and bigger States separately for rural and urban also by sex have been introduced in this Report since 2008.

3. The present Report is the eighth in the series that has been prepared based on data collected from new SRS sample units selected on the 2001 Census frame. Apart from the fertility and mortality indicators, this Report includes data on crude birth rate, crude death rate and infant mortality rates at Natural Division (group of contiguous districts) level for rural areas of a State. In the present Report, an executive summary containing important findings has been added to enhance its utility. For those who are interested in trend analysis, the National level trends for few core indicators have been presented since 2004 (the base year of new frame). Detailed State-level tables on these indicators for 2007-2012 have also been added to provide a glimpse of the trends. Henceforth, these additions would become a regular feature of the Report. With the modification of the system and consistent efforts of SRS Division and the Directorates of Census Operations, it has been our endeavor to release the report by year end.

4. The SRS has been a joint effort of the Central and State Governments. This study has been made possible with the active involvement of staff and officers of the Directorates of Economics & Statistics of Kerala and Maharashtra as well as the staff and officers of the Directorates of Census Operations, Map Division and the SRS Wing of the Vital Statistics Division at the headquarters. I am thankful to all of them. I must specially place on record my appreciation of the efforts put in by Shri Jaspal Singh and Dr. D. Giri, Deputy Directors, Smt Gracy James, Assistant Director, Shri Jagat Singh and Shri Brijesh Kumar S.I. Grade-I, Shri Ravi Kant, S.I Grade- II, Smt. Prabha Agarwal and Shri R.S. Kar, Data Entry Operators, in the preparation of this Report supervised by Shri Rohit Bhardwaj, Deputy Registrar General under the overall guidance of Dr. Vijay P. Goel, Deputy Director General.

D E F I N I T I O N S

$$\text{Crude birth rate (CBR)} = \frac{\text{Number of live births during the year}}{\text{Mid-year population}} \times 1000$$

$$\text{Age-specific fertility rate (ASFR)} = \frac{\text{Number of live births in a particular age-group}}{\text{Mid-year female population of the same age-group}} \times 1000$$

$$\text{General fertility rate (GFR)} = \frac{\text{Number of live births in a year}}{\text{Mid-year female population in the age-group (15-49) years}} \times 1000$$

$$\text{Total fertility rate (TFR)} = \frac{5 \times \sum_{15\text{-}19}^{45\text{-}49} \text{ASFR}}{1000}$$

$$\text{Gross reproduction rate (GRR)} = \frac{5 \times \sum_{15\text{-}19}^{45\text{-}49} \text{ASFR for female live births}}{1000}$$

$$\text{Age-specific marital fertility rate (ASMFR)} = \frac{\text{Number of live births in a particular age-group}}{\text{Mid-year married female population of the same age-group}} \times 1000$$

$$\text{General marital fertility rate (GMFR)} = \frac{\text{Number of live births in a year}}{\text{Mid-year married female population in the age-group (15-49) year}} \times 1000$$

$$\text{Total marital fertility rate (TMFR)} = \frac{5 \times \sum_{15\text{-}19}^{45\text{-}49} \text{ASMFR}}{1000}$$

$$\text{Crude death rate (CDR)} = \frac{\text{Number of deaths during the year}}{\text{Mid-year population}} \times 1000$$

Age-specific mortality rate (ASMR) = Number of deaths in a particular age-group / Mid-year population of the same age-group x 1000

Under-five Mortality Rate = The under-five mortality is the probability (${}_5q_0$) that a child born in a specific year or time period will die before reaching the age of five, subject to current age specific mortality rates. It is expressed as a rate per 1,000 live births.

Infant mortality rate (IMR) = Number of infant deaths during the year / Number of live births during the year x 1000

Infant mortality rate comprises of two parts viz. Neo-natal mortality rate and Post neo-natal mortality rate. The neo-natal mortality rate also comprises of two parts viz. Early neo-natal mortality rate and late neo-natal mortality rate. These are defined as:

Neo-natal mortality rate (NMR) = Number of infant deaths of < than 29 days during the year / Number of live births during the year x 1000

Early neo-natal mortality rate = Number of infant deaths of < than 7 days during the year / Number of live births during the year x 1000

Late neo-natal mortality rate = Number of infant deaths of 7 days to < than 29 days during the year / Number of live births during the year x 1000

Post neo-natal mortality rate (PNMR) = Number of infant deaths of 29 days to < than one year during the year / Number of live births during the year x 1000

Peri-natal mortality rate (PMR) = Number of still births and infant deaths of < than 7 days during the year / Number of live births and still births during the year x 1000

Still birth rate (SBR) = Number of still births during the year / Number of live births and still births during the year x 1000

EXECUTIVE SUMMARY

The Sample Registration System(SRS) is the largest demographic survey in the country mandated to provide annual estimates of fertility as well as mortality indicators at the State and National level. The present Report contains data on fertility and mortality indicators for the year 2012 for India and bigger States. The estimates are segregated by residence and also by gender wherever required.

2. The salient findings of the report are summarized below.

- ❖ The Crude Birth Rate(CBR) at the National level during 2012 stands at 21.6 exhibiting a decline of 0.2 points over 2011. The maximum CBR has been reported in respect of Bihar (27.7) and the minimum in respect of Kerala (14.9).

- ❖ There has been a decline of 1.5 points in the CBR for the country during 2007-12. The corresponding decline in rural CBR has been to the extent of 1.6 points against 1.2 points in urban CBR.

- ❖ The Crude Death Rate(CDR)for the countryhas marginally declined to 7.0 in 2012 from 7.1 in 2011.The maximum CDR has been reported for Odisha (8.5) and the minimum for Delhi(4.2).

- ❖ During last five years, the decline in National CDR has been to the tune of 0.4 points. The corresponding decline in female CDR has been by 0.5 points against 0.3 points in male CDR.

- ❖ The Infant Mortality Rate(IMR) has also registered 2 points decline to 42 in 2012from 44 in 2011 at the National level. The maximum IMR has been observed in Madhya Pradesh (56) and the minimum in Kerala (12).During the corresponding period, Neo-natal Mortality Rate(NNMR) has declined by 2 points.

- ❖ IMR for the country has come down to 42 in 2012 from 55 in 2007, a decline of 13 points over last 5 years and an annual average decline of about 2.5 points. The corresponding decline in rural IMR has been to the tune of 15 points (61 in 2007 to 46 in 2012) against a decline of 9 points in urban IMR (37 in 2007 to 28in 2012). Both the gender have shown similar decline in 2007-12.

- ❖ Despite this decline, one in every 24infant at the National level, one in every 22infant in rural areas and one in every 36infant in urban areas still die within one year of life.

- ❖ During 2012, U5MR for the country has shown a decline of 3 points over 2011(52 in 2012 against 55 in 2011). There has been decline of 2 points in male U5MR and 3 points in female U5MR during the corresponding period.

- ❖ Sex Ratio at Birth for the country has gone up by 2pointto 908 in 2010-2012from 906 in 2009-2011.Chhattisgarh has reported the highest Sex Ratio at Birth (979) while Haryana, the lowest (857).

- After exhibiting stability from 2007-09 to 2009-11, the Sex ratio of child (age group 0-4)for the country has been decreased to 912 in 2010-2012.The highestand the lowest Child Sex Ratio havealso been reported in Chhattisgarh (1011) and Haryana (837) respectively.

- The proportion of females getting married before legal age of marriage has declined to 2.9 percent as against 7.6 percent reported in 2007 at National level.

- Total Fertility Rate (TFR) for the country is stable to 2.4in2011 and 2012. During 2012, Bihar has reported the highest TFR (3.5) while Himachal Pradesh, Punjab, Tamil Nadu & West Bengal has reported the lowest TFR (1.7). It is noteworthy that the replacement level of TFR, viz 2.1, has been attained by Andhra Pradesh (1.8), Delhi (1.8), Himachal Pradesh (1.7), Jammu & Kashmir (1.9) Karnataka (1.9), Kerala (1.8), Maharashtra (1.8), Punjab (1.7), Tamil Nadu (1.7), West Bengal (1.7)& Odisha (2.1).

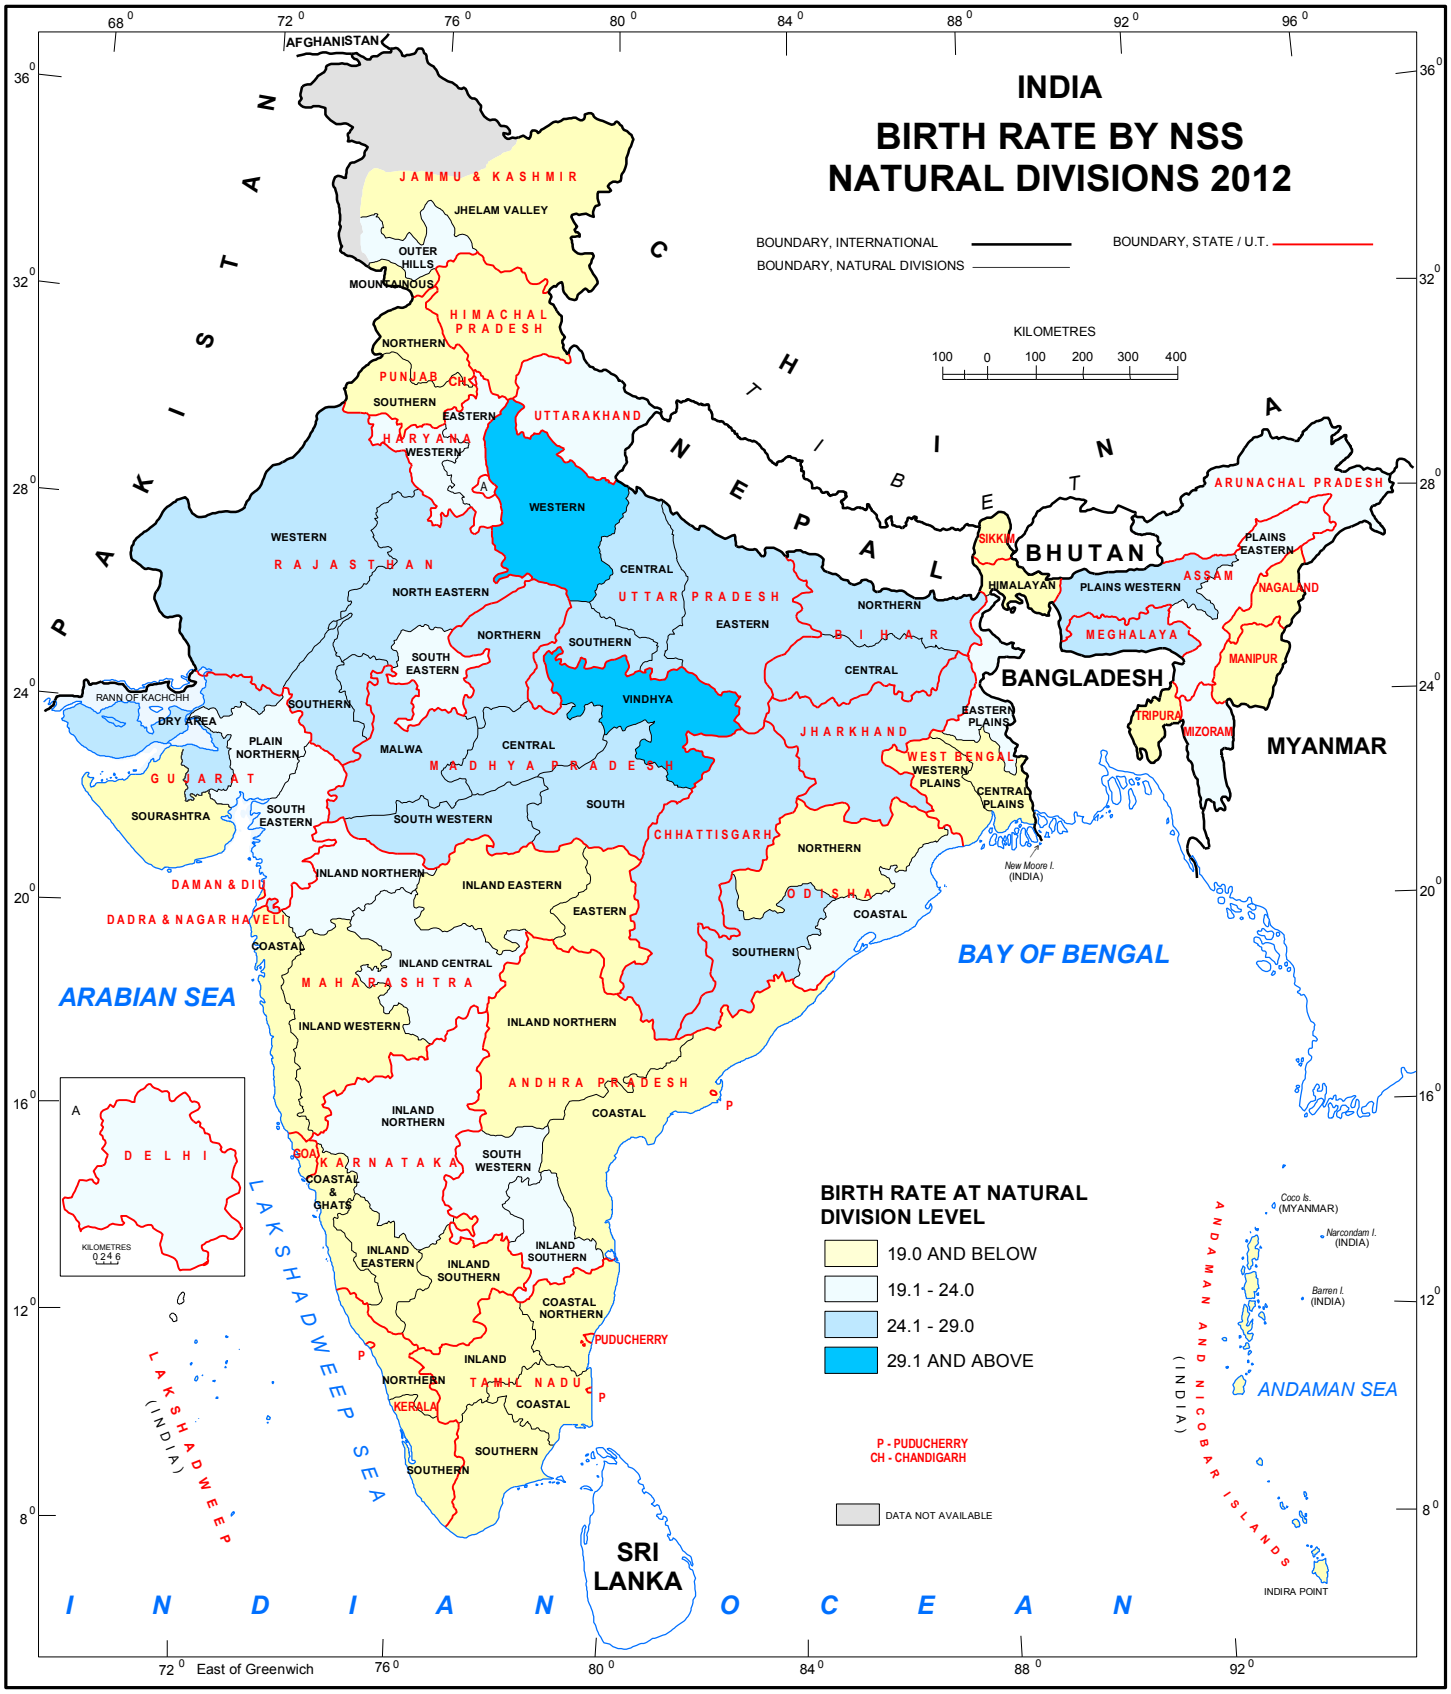

- At present, a rural woman (having a TFR of 2.6) at the National level would have about one child more than an urban woman (having a TFR of 1.8), on average.

- During 2007-2012, there has been a decline of 0.3 points in TFR at the National level. The corresponding decline in rural and urban TFRs has been to the extent of 0.4 and 0.2 points respectively.

- In case of about 73 percent live births,the mothers have received the medical attention at delivery either atGovernment hospital or at Private hospital in 2012 against the 67 percent in 2011.

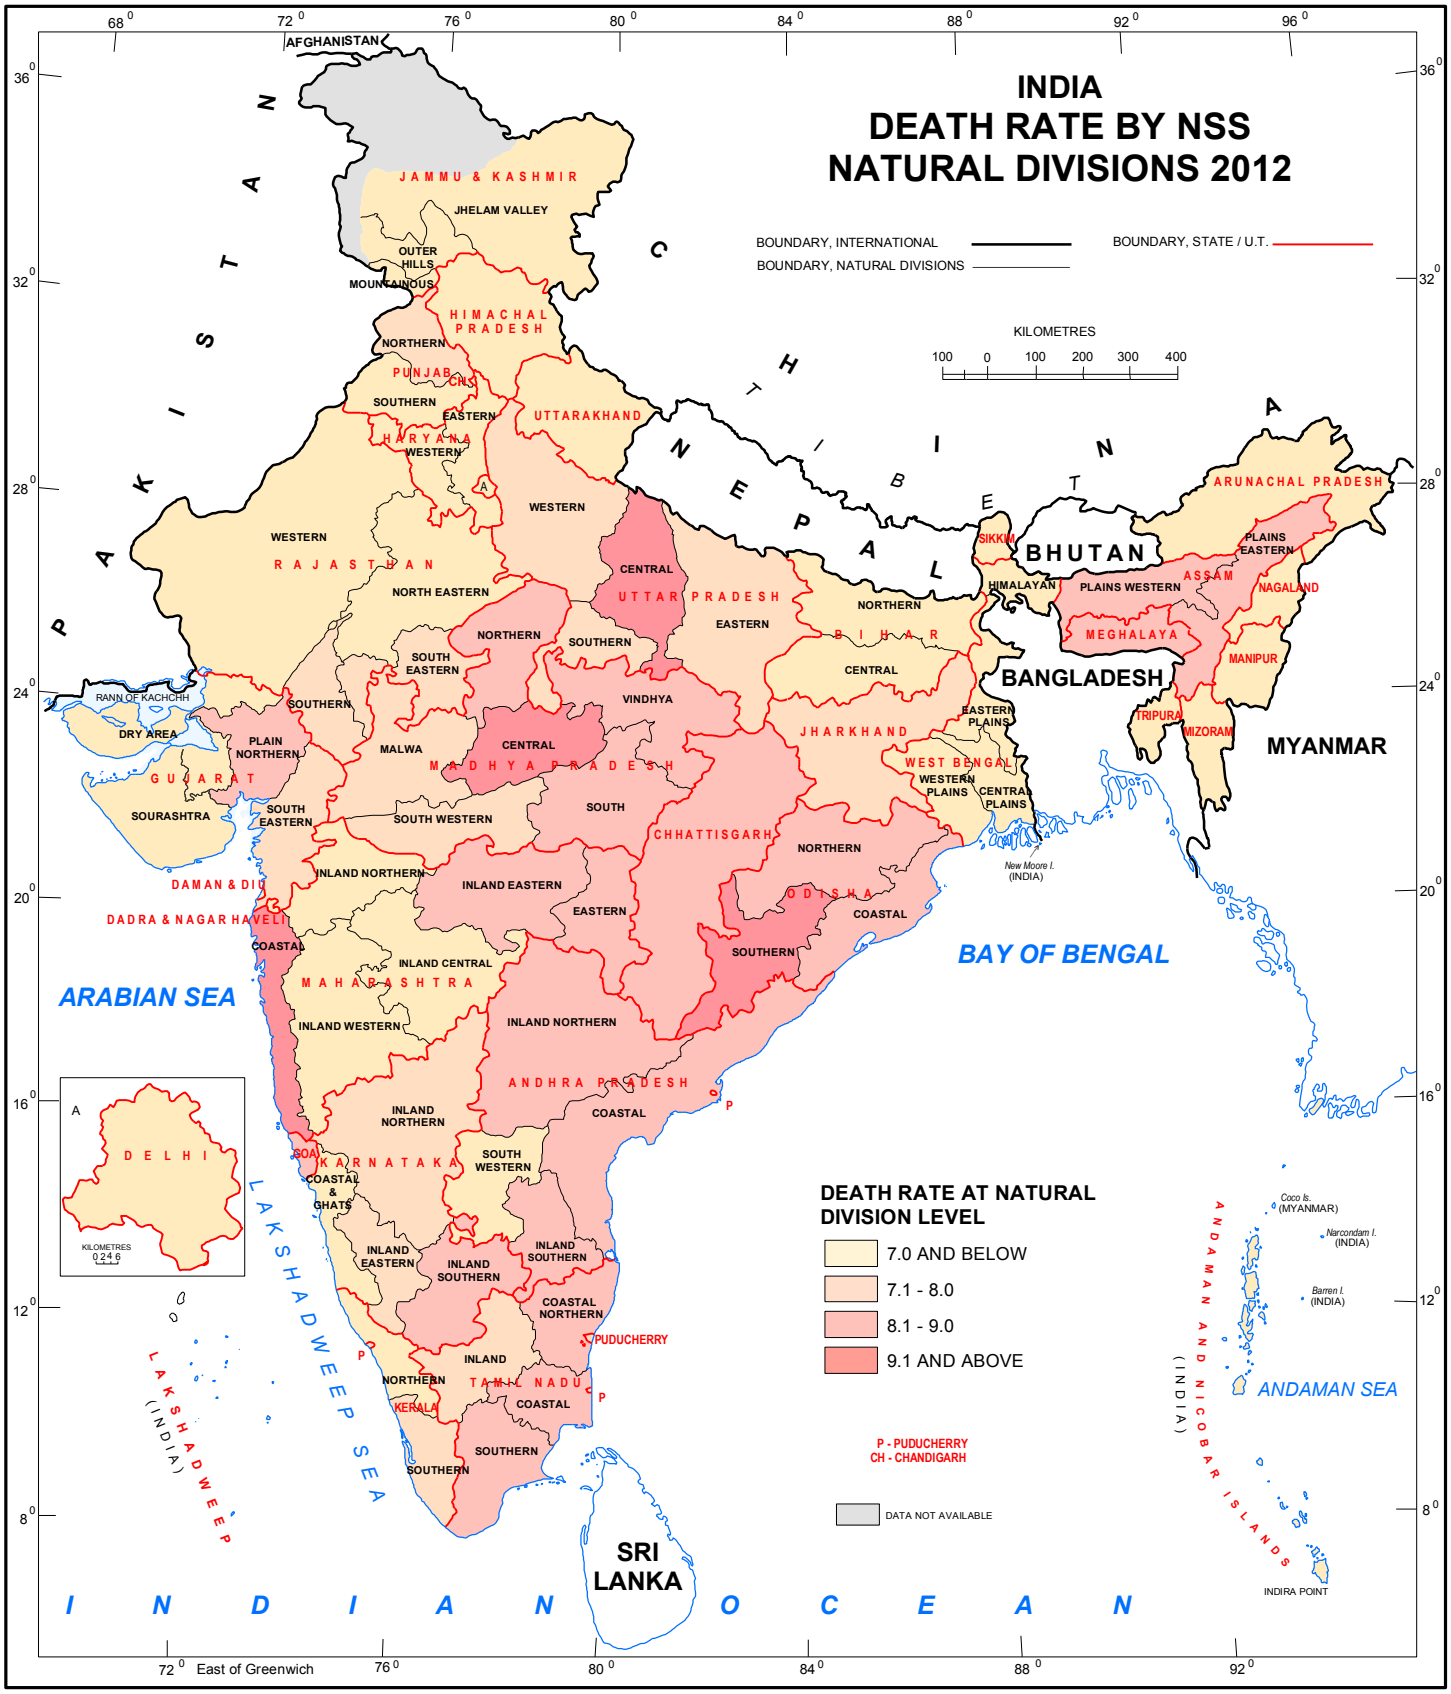

- There has been a marginal increase of 0.4 percent in case of deaths wherethe deceased have received medical attention before death either atGovernment hospital or at Private hospital in 2012(34.6) over 2011(34.2). There has been just an increase of about 6 percent in deaths where the deceased had received medical attention before death in hospitals during 2007-2012.

CENSUS OF INDIA 2011

CENSUS OF INDIA 2011

CHAPTER - 1

INTRODUCTION

Registration of births and deaths is an important source for demographic data for socio-economic development and population control in developing countries. The data on population growth, fertility and mortality serves as the prime constituent for population projections. Apart from these vital indicators, an adequate evaluation of a number of programs in the health sector, including family planning, maternal and reproductive health, immunization programs, is dependent upon the availability of accurate, up-to-date fertility and mortality data. In India, the need for dependable demographic data was felt soon after independence heralding the era of five year planning. The registration of births and deaths started on voluntary basis and there was no uniformity in statistical returns resulting in both under-registration and incomplete coverage. In order to unify the Civil Registration activities, the Registration of Births & Deaths Act, 1969 was enacted. Despite having the registration of birth & death compulsory under the statute, the level of registration of births and deaths under the Act has continued to be far from satisfactory in several States/UTs. With a view to generate reliable and continuous data on these indicators, the Office of Registrar General, India, initiated the scheme of sample registration of births and deaths in India popularly known as Sample Registration System (SRS) in 1964-65 on a pilot basis and on full scale from 1969-70. The SRS since then has been providing data on a regular basis.

1.2 The demographic scenario in the country has been undergoing a change since the inception of SRS; however, the profile and rate of change is not uniform across all the States/UTs. Overall, the crude birth rate in the country has come down from 36.9 per one thousand population in 1971 to 21.6 in 2012, whereas the crude death rate has declined from 14.9 to a low of 7.0 in the same period. The infant mortality rate, which is an important indicator of the health status of the country, has registered a significant decline from 129 per one thousand live births in 1971 to 42 in 2012. During the period, the total fertility rate of the country has declined from 5.2 to 2.4. To fulfill its objective of monitoring the changes in vital indicators, the SRS sampling units are retained for about ten years, making it a panel household survey.

1.3 Various methods based on the application of sampling techniques have been tried and tested in many developing countries. Such methods include single and multi-round retrospective surveys and the dual record system. The SRS in India is based on a dual record system. The field investigation under Sample Registration System consists of continuous enumeration of births and deaths in a sample of villages/urban blocks by a resident part-time enumerator, and an independent six monthly retrospective survey by a full-time supervisor. The data obtained through these two sources are matched. The unmatched and partially matched events are re-verified in the field to get an unduplicated count of correct events. The advantage of this procedure, in addition to elimination of errors of duplication, is that it leads to a quantitative assessment of the sources of distortion in the two sets of records making it a self-evaluating technique.

1.4 The revision of SRS sampling frame is undertaken every ten years based on the results of latest census. While changing the sample, modifications in the sampling design; wider representation of population; overcoming the limitations in the existing scheme; meeting the additional requirements etc. are taken into account. The first replacement was carried out in 1977-78 and the last being in 2004. Whereas the

replacement of samples in earlier years was undertaken in phases spread over 2-3 years, the replacement in 2004 was done in one go within a year. The following table provides the sample size in different replacement period.

Statement 1
Number of sample units at different replacement period

Residence	1969-70	1977-78	1983-85	1993-95	2004
Rural	2432	3684	4176	4436	4433
Urban	1290	1738	1846	2235	3164
Total	3722	5422	6022	6671	7597

1.5 The earlier sample was based on the reliability of birth rate at the State level, whereas the 2004 sample is estimated using IMR reliability at natural division level. The present report 'SRS Statistical Report, 2012' is the ninth report of the new sample based on Census 2001 frame.

1.6 The main objective of SRS is to provide reliable estimates of birth rate, death rate and infant mortality rate at the natural division level for rural areas and at the State level for urban areas. Natural divisions are National Sample Survey (NSS) classified group of contiguous administrative districts with distinct geographical and other natural characteristics. It also provides data for other measures of fertility and mortality including total fertility, infant and child mortality rate at higher geographical levels.

1.7 In order to give more impetus covering both rural and urban areas and wider representation of sample villages and urban blocks for Causes of Death; the Survey of Causes of Deaths (Rural) has been merged with Sample Registration System from 1st January 1999. The primary objective of the survey is to build up statistics on "Most Probable Causes of Death" for rural and urban areas using "lay diagnosis reporting (Post Death Verbal Autopsy)" method through post death enquiry based on symptoms, conditions, duration and anatomical site of the disease as observed by family members of the deceased at the time of death. As the collection of causes of death requires knowledge on medical terminologies, symptoms of disease and interview techniques, the supervisors of SRS have been trained by medical professionals in the art of collection of data on causes of deaths. A well-designed VA instrument has been developed and introduced in SRS. Supervisors of all States have been trained with the new VA instrument. To enhance the objectivity of the system, the role of SRS supervisor is restricted to faithfully collect data on sign and symptoms by interviewing the close relative of the deceased. Apart from recording the responses for closed questionnaire, the supervisor has to fill up the narrative portion of the VA instrument. A special bulletin on levels of Maternal Mortality in India 2007–09 has been released.

Structure of the Sample Registration System

1.8 The main components of SRS are:

(i) Base-line survey of the sample units to obtain demographic details of the usual resident population of the sample areas;

(ii) Continuous (longitudinal) enumeration of vital events pertaining to usual resident population by the enumerator;

(iii) Independent retrospective half-yearly surveys for recording births and deaths which occurred during the half-year under reference and up-dating the Houselist, Household schedule and the list of women in the reproductive age group along with their pregnancy status by the Supervisor;

(iv) Matching of events recorded during continuous enumeration and those listed in course of half- yearly survey;

(v) Field verification of unmatched and partially matched events; and

(vi) Filling of Verbal Autopsy Forms for finalized deaths.

1.9 **Baseline Survey:** The base-line survey is carried out prior to the start of continuous enumeration. This involves preparation of a notional map of the area to be surveyed, house numbering and house listing and filling-in of a household schedule. The supervisor prepares a notional map with the help of the enumerator showing important landmarks and location of the houses to be covered in the sample unit. Subsequently, a list of houses/households to be covered by the sample in the House List (Form-1) is prepared and the Household Schedule (Form-2) is filled in. In the Household Schedule (Form-2), the residential status and other demographic particulars of each individual residing in the household viz. identification code, name, sex, date of birth, age, educational/marital status and relation to head of household, etc. are recorded. The inmates of public institutions like hotels, inns, schools and hospitals are excluded, but households living permanently within the compound of such institutions are covered. A list of all women in the reproductive span along with their pregnancy status is also prepared in Form 3 at the time of the base line survey.

1.10 **Continuous enumeration:** The enumerator maintains a Birth Record (Form 4) and a Death Record (Form 5) in respect of his/her area. The enumerator is expected to record all births and deaths occurring within the sample unit, as well as those of the usual residents occurring outside the sample unit. The events in respect of visitors occurring within the sample unit are also listed, but these are not taken into account while calculating rates. Thus, the events to be netted by the enumerator are those pertaining to: (i) usual residents inside the sample unit; (ii) usual residents outside the sample unit; (iii) in-migrants present; (iv) in-migrants absent; and (v) visitors inside the sample unit.

1.11 For ensuring complete netting, the enumerator uses different sources to get information of the occurrence of vital events in the sample unit. These include the help of the village priest, barber, village headman, midwife and such other functionaries. The enumerators maintain contact with these informants at frequent intervals and collects information about the occurrence of births and deaths. On being informed about the occurrence of an event, the enumerator visits the concerned household and records the prescribed particulars. The enumerator also keeps in touch with other socially important persons and visits local or nearby hospitals, nursing homes, cremation or burial grounds, at frequent intervals to keep updated about the occurrence of events. Besides, enumerator maintains and updates a list of all women in the reproductive span along with their pregnancy status, which helps in better netting of all the births. Despite all these efforts, the enumerator may miss information about some of the events and is, therefore, required to visit all the households once a month so as to ensure that all the events have been recorded.

1.12 **Half-yearly survey:** Half-yearly survey is carried out independently in each sample unit by a full-time supervisor. The supervisor belonging to the statistical cadre of the State Census Directorates (either a Compiler or a Sr. Compiler or a Statistical Investigator or any suitable official) visits each household in the sample unit and records

the particulars of births and deaths in Forms 9 & 10 respectively in respect of all the usual residents and visitors (only those occurring within the sample unit) which had occurred during the half-yearly period (January-June or July-December) under reference. Simultaneously, the house-list, the household schedule and the pregnancy status of women is updated by making entries of changes, if any. While carrying out this survey the supervisor does not have access to the birth and death records of the enumerator for the same periods which are withdrawn from the field before the supervisor's visit for the half yearly survey.

1.13 **Matching:** On completion of the half-yearly survey, the events captured in the Forms 9 & 10 (filled-in by the supervisors) are compared with those in the Forms 4 & 5 (filled-in by the enumerators). This is done at the office of Directorate of Census Operations for all States except for rural areas of Kerala and Maharashtra, where it is done at the Directorate of Economics and Statistics of the respective States. Selected important entries in the enumerator's and supervisor's record are matched item by item and events are classified as fully matched, partially matched and unmatched. The items generally considered for matching for birth events are: Identification code of the head of Household and mother, Relationship of the mother to head, date of live birth, month in case of still birth/abortion, sex in case of live birth /still birth and the items considered for death events are: identification code of the head of household and mother in infant death, relationship of the deceased to head, date of death and sex of the deceased.

1.14 **Field verification of unmatched and partially matched events:** Every unmatched or partially matched event is verified by a visit to the concerned household. This is done either by a third person or jointly by the supervisor and the enumerator, depending upon the availability of staff.

Sample design

1.15 The Sample design adopted for SRS is a uni-stage stratified simple random sample without replacement except in stratum II (larger villages) of rural areas, where two stage stratification has been applied. In rural areas of bigger States (population with ten million or more as per Census 2001), the NSS natural division is the first level of geographical stratification. The overall stratification in rural areas has been done on size of villages with villages having population less than 2,000 forming Stratum I and villages with population 2,000 or more forming Stratum II. Smaller villages with population less than 200 were excluded from the sampling frame in such a manner that the total population of villages so excluded did not exceed 2 per cent of the total population of the State. The number of sample villages in each State was allocated to the substrata proportionally to their size (population). The villages within each size stratum were ordered by the female literacy rate based on the Census 2001 data, and three equal size substrata were established. The sample villages within each substratum were selected at random with equal probability. In the case of villages of Stratum II, each sample village with a population of 2,000 or more was subdivided into two or more segments in a way that none of the segments cut across the Census Enumeration Blocks (CEBs) and the population of each segment formed by grouping the contiguous CEBs was approximately equal and did not exceed 2000. A frame of segments was then prepared and the selection of segments was done at random at the second sampling stage for the SRS enumeration.

1.16 In urban areas, the categories of towns/cities have been divided into four strata based on the size classes in contrast to the six strata in the earlier sampling frame. Towns with population less than one lakh have been placed under stratum I, towns/cities with population one lakh or more but less than 5 lakhs under stratum II,

towns/cities with population 5 lakh or more under stratum III and four metro cities of Delhi, Mumbai, Chennai and Kolkata as separate strata viz. stratum IV. The sampling unit in urban area is a Census Enumeration Block. The Census Enumeration Blocks within each size stratum were ordered by the female literacy rate based on the Census 2001 data, and three equal size substrata were established. The sample Census Enumeration Block within each substratum was selected at random with equal probability. A simple random sample of these enumeration blocks have been selected within each sub-strata without replacement from each of the size classes of towns/cities in each State/Union Territory.

Sample size

1.17 The Infant Mortality is the decisive indicator for estimation of sample size at Natural Division, the ultimate level for estimation and dissemination of indicators for rural areas. The permissible level of error has been taken as 10 prse (percentage relative standard error) at Natural Division level for rural areas and 10 prse at State level for urban areas, in respect of major States having population more than 10 million as per Census 2001. For minor States, 15 prse has been fixed at the total State level. By and large the above criteria has been followed, however, there have been a few exceptions, on account of operational constraints. Based on the above criteria, the number of units has been increased from 6671 to 7597 (4433 in rural and 3164 in urban areas). Statement 2 shows the number of sample units and population covered in 2012, separately for rural and urban areas of all the States and Union Territories.

Statement 2
Number of sample units and population covered
India, States and Union Territories, 2012

India/States/ Union territories	Number of sample units			Population covered (in'000)		
	Total	Rural	Urban	Total	Rural	Urban

Puducherry	50	17	33	48	27	21

Note: 'Total' population may not add up to 'Rural' and 'Urban' population due to rounding.

Estimation procedure

1.18 Estimates of population, births, deaths and infant deaths for natural division in rural areas for bigger States and at State level for smaller States separately for rural/urban areas for all States/UTs are obtained using unbiased method of estimation. The estimates of birth, death and infant death rates are obtained as the ratios of the 'estimated births to estimated population', 'estimated deaths to estimated population' and 'estimated infant deaths to estimated births' respectively expressed in terms of per thousand.

Organization

1.19 From 1995, the SRS is being implemented mainly through the Directorates of Census Operations in both rural and urban areas. However, in the States of Kerala and Maharashtra the implementation of field work and their monitoring for rural units has been entrusted to the Directorate of Economics & Statistics of the respective State Government and the urban units to the Directorate of Census Operations.

1.20 For continuous enumeration, there is a resident part-time enumerator for each of the sample unit, who is usually an anganwadi worker/teacher and is paid honorarium for this work. The independent retrospective half-yearly surveys are carried out by the full-time supervisors who are the regular staff of the State Directorate of Census Operations. One supervisor is usually assigned a set of 10 to 12 sample units for conducting half-yearly surveys. Each State headquarters have a complement of staff necessary for planning and organizing various field operations, imparting training to the field staff, effecting proper supervision and control, ensuring regular flow of returns from the field, forwarding of various returns to the Office of the Registrar General, India and for undertaking certain minimum tabulations.

1.21 At the National level, the Vital Statistics Division of the office of the Registrar General, India coordinates the implementation work, formulates and prescribes necessary standards, provides necessary instructions and guidance, undertakes tabulation, analysis and dissemination of data.

Training and Supervision

1.22 Before the commencement of work, requisite training is imparted to the enumerators to make them understand their role and responsibility. This is followed by trainings at periodic intervals to clarify the doubts and also to keep the enumerators update with the improvements introduced in the system from time to time. Besides, they are also provided with a manual of instructions for day-to-day consultation to remove the difficulties in course of work. Supervisors are also given necessary training with a view to enabling them to carry out the half-yearly surveys properly and efficiently. They are also provided with a manual of instructions for this purpose. In addition, various State officials associated with the implementation of the SRS are also given necessary training. There is a manual for the staff of the State headquarters which provides detailed instructions and guidance with regard to the various stages of work involved at the State level. The manual is very comprehensive and covers all aspects of the system.

1.23 Supervision of the field work is an important component of SRS. The supervisory level officials such as the Investigator, Assistant Director, Deputy Director, Joint Director and Director undertake this. Officers at the State headquarters undertake visits to sample units and inspect the work at the field level. Officers of Vital Statistics Division in the headquarters also undertake surprise checks and visits in SRS units for control of the quality of work.

SRS Forms and their flow

1.24 For collecting information on population and vital events various forms/schedules have been prescribed under the SRS. Depending upon various operations under the system, the following 17 types of forms are in use:

A. Baseline Survey Forms

Form 1: House List
Form 2: Household Schedule
Form 3: Pregnancy Status of women

B. Continuous Enumeration Forms

Form 4: Outcome of Pregnancy recorded by Enumerator (January-June/July-December)
Form 5: Deaths recorded by Enumerator (January-June/July-December)
Form 6: Monthly report of Outcome of Pregnancy
Form 7: Monthly report of Deaths

C. Half yearly Survey Forms

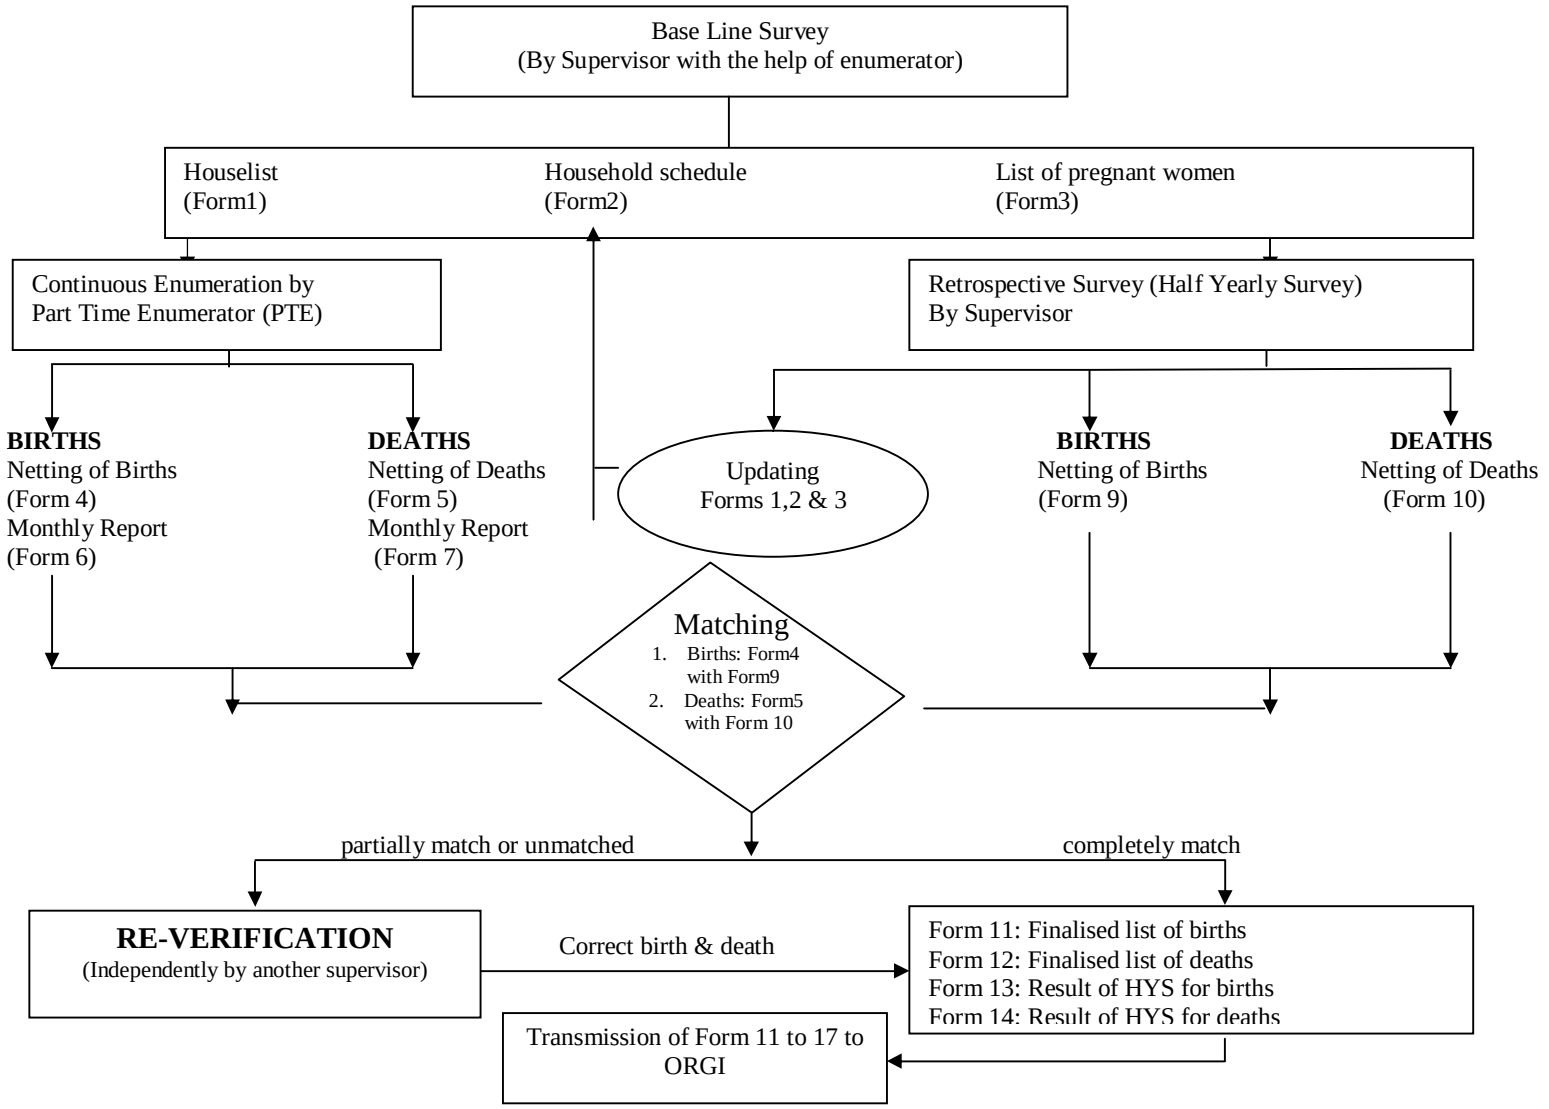

Form 9: Outcome of Pregnancy recorded by Supervisor (January-June/July-December)
Form 10: Deaths recorded by Supervisor (January-June/July-December)
Form 15: Distribution of usual resident population by age, sex and marital status (as on 1st July/1st January)
Form 16: Distribution of Female population by broad age groups and levels of education (as on 1st July/1st January)
Form 17: Number of females who got married by age at effective marriage (January-June/July-December)

D. Compilation/Tabulation Forms

Form 8: Consolidated monthly report on births and deaths
Form 11: Finalised list of Outcome of Pregnancy (January-June/July-December)
Form 12: Finalised list of Deaths (January-June/July-December)
Form 13: Results of the HYS for Outcome of Pregnancy (January-June/July-December)
Form 14: Results of the HYS for Deaths (January-June/July-December)

1.25 The enumerator records the details of each birth and death event occurred during the reference period in Forms 4 and 5 respectively on a continuous basis. A monthly report on births and deaths (Forms 6 and 7) is required to be sent by the enumerators to the State headquarters in the first week of the following month. The relevant entries of birth and death records in monthly report are copied from six monthly records and sent to the State headquarter. On the basis of the monthly reports received from the sample units, the State headquarters are required to prepare a consolidated monthly report (Form 8) and forward the same to the Office of the Registrar General, India by the end of the following month. The monthly reports for the individual units remain at the State headquarters. The supervisor records the details of each birth and death event occurring during the six-month reference period in Forms 9 and 10 respectively. After matching of each birth and death event recorded in Forms 4 and 5 with those in Forms 9 and 10 and verification of partially and unmatched events in the field, finalized Forms 11 and 12 are prepared after necessary corrections and inclusion of additional events recorded during the survey. These forms are sent to the Office of the Registrar General, India along with the half-yearly survey results in Forms 13, 14, 15, 16 and 17. Flow chart of SRS returns is shown in Chart 1.

Chart 1: Flow Chart

CHAPTER - 2

POPULATION COMPOSITION

The data on population by age and sex is vital for demographers, health administrators etc. for planning and evaluation of various developmental and health programs. The classification of rural/urban, sex and marital status by age unveils the characteristics of population composition and provides disaggregated data for target oriented projects. Being one of the most important demographic characteristics, data on age is collected and updated in both half-yearly surveys of SRS for all the members of the household covered in the sample units.

2.2 As per available data from SRS, there has been a gradual decline in the share of population in the age group 0-14 from 41.2 to 38.1 per cent during 1971 to 1981 and 36.3 to 29.1 percent during 1991 to 2012, whereas, the proportion of economically active population (15-59 years) has increased from 53.4 to 56.3 percent during 1971 to 1981 and 57.7 to 62.6 per cent during 1991 to 2012. On account of better education, health facilities and increase in life expectancy, the percentage of elderly population (60+) has gone up from 5.3 to 5.7 percent and 6.0 to 8.3 percent respectively during the periods under reference. Marital status and Female mean age at marriage are essential constituents to monitor fertility and population growth. The data on marital status has been included in SRS from 1991, whereas on Female mean age at marriage is from 1990. There is a marginal increase in the proportion of married Female from 45.7 in 1991 to 47.0 in 2012, whereas the proportion of widowed/divorced/separated female has remained stagnant at 5.2. The mean age at effective marriage for Female has improved from 19.3 years in 1990 to 21.2 years in 2012.

2.3 This chapter provides data on percentage distribution of population by age, sex and residence for all broad age groups from 0-4, 0-14, 15-59 and 60+ for India and bigger States. It also includes data on percentage distribution of population by marital status for total population, 10+ and 15+ ages by sex and residence. The state-wise variations in Female age at effective marriage and their corresponding proportions have also been presented in this chapter.

Age composition

2.4 Age composition by residence and broad age groups 0-14, 15-59 and 60+ for the year 2012 at the National level is shown below in Statement 3. The age group 0-14 is further sub-categorized into the age groups 0-4, 5-9 and 10-14. It is observed that for most of the age groups, Male-Female differences in the age distribution of population are negligible except in the combined age-group of 0-14, 15-59, 60+ , 15-64 & 65+. In the age-group 0-14, Male population is about one percent more than Female, whereas in the age-group 60+ as also 65+, percentage of Female is 0.7 percent more than Male. The proportion of young children in the age group 0-4 and also the proportion of population in the age group 0-14 are higher in rural areas than in urban areas both for Male and Female. A higher proportion of Male and Female in the working age group 15-59 live in urban areas as compared to rural areas. Chart 2 gives pictorial presentation of data shown in Statement 3. Table 1 gives percentage distribution of estimated population by quinquennial age groups, sex and residence for India and bigger States.

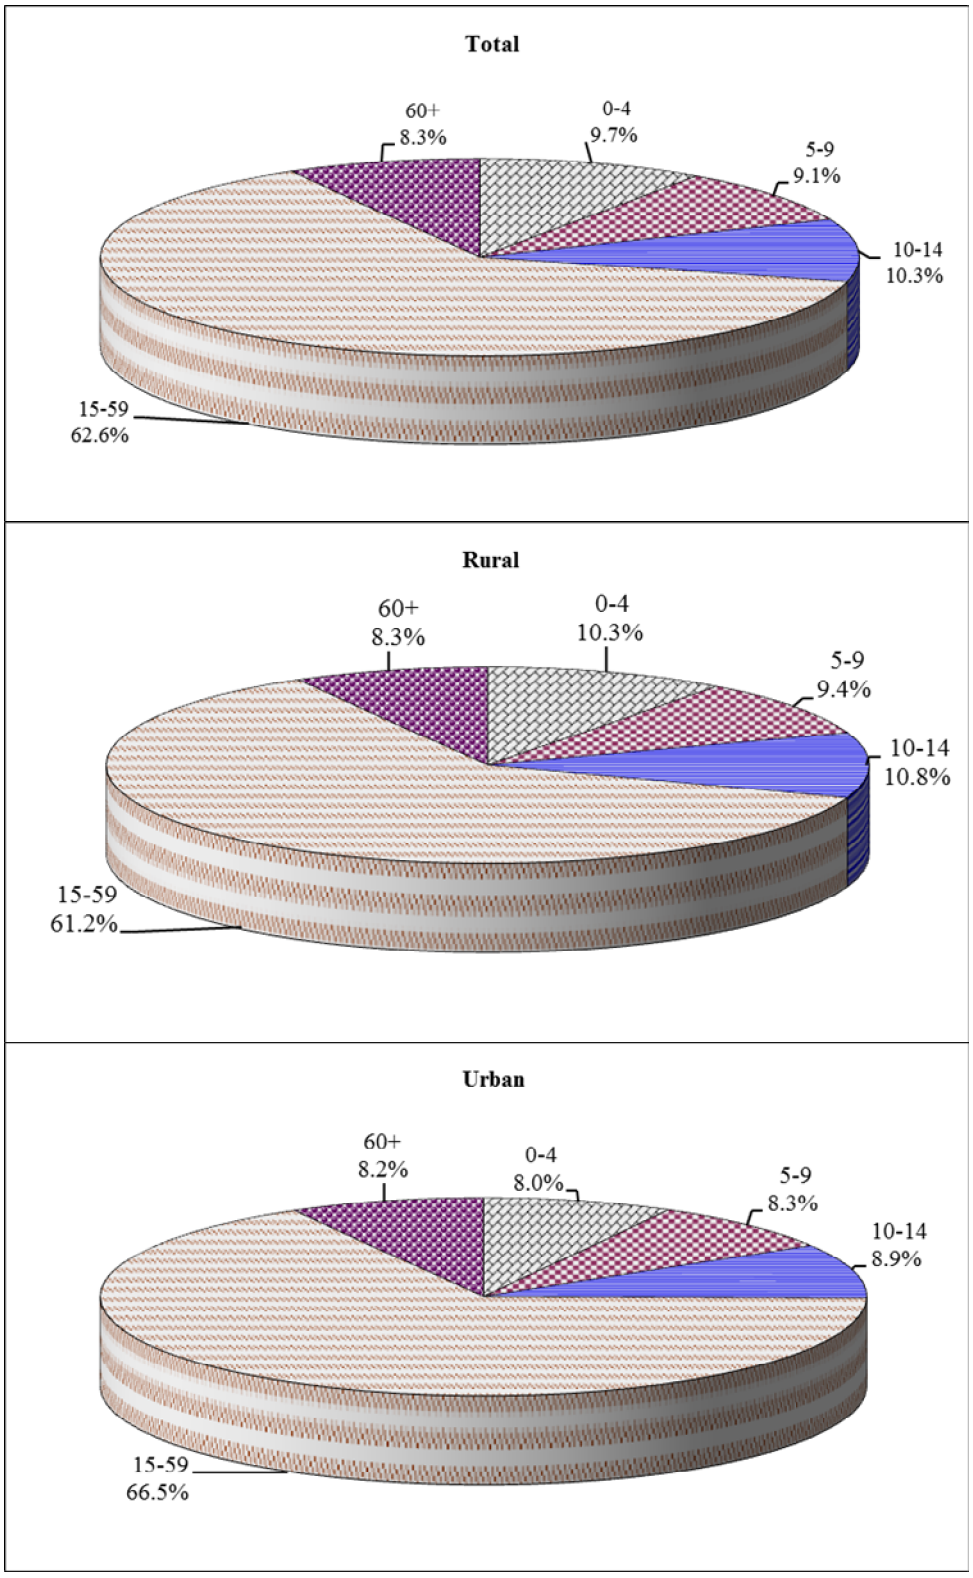

Statement 3

Percentage distribution of population by broad age groups to total population by sex and residence, India, 2012

Residence	Sex	Broad age groups (years)							
		0-4	5-9	10-14	0-14	15-59	60+	15-64	65+
Total	Total	9.7	9.1	10.3	29.1	62.6	8.3	65.6	5.3
	Male	9.9	9.3	10.6	29.7	62.4	7.9	65.3	5.0
	Female	9.4	8.9	10.1	28.4	63.0	8.6	65.9	5.7
Rural	Total	10.3	9.4	10.8	30.5	61.2	8.3	64.2	5.4
	Male	10.5	9.5	11.1	31.1	60.9	7.9	63.9	5.0
	Female	10.0	9.2	10.6	29.8	61.5	8.7	64.4	5.7
Urban	Total	8.0	8.3	8.9	25.2	66.5	8.2	69.6	5.2
	Male	8.2	8.5	9.2	25.9	66.2	7.9	69.3	4.9
	Female	7.8	8.1	8.6	24.5	66.9	8.6	69.9	5.5

Note: Total percentage may not add to 100 on account of rounding in broad age groups

Chart 2 : Percentage distribution of population by broad age groups and residence, India, 2012

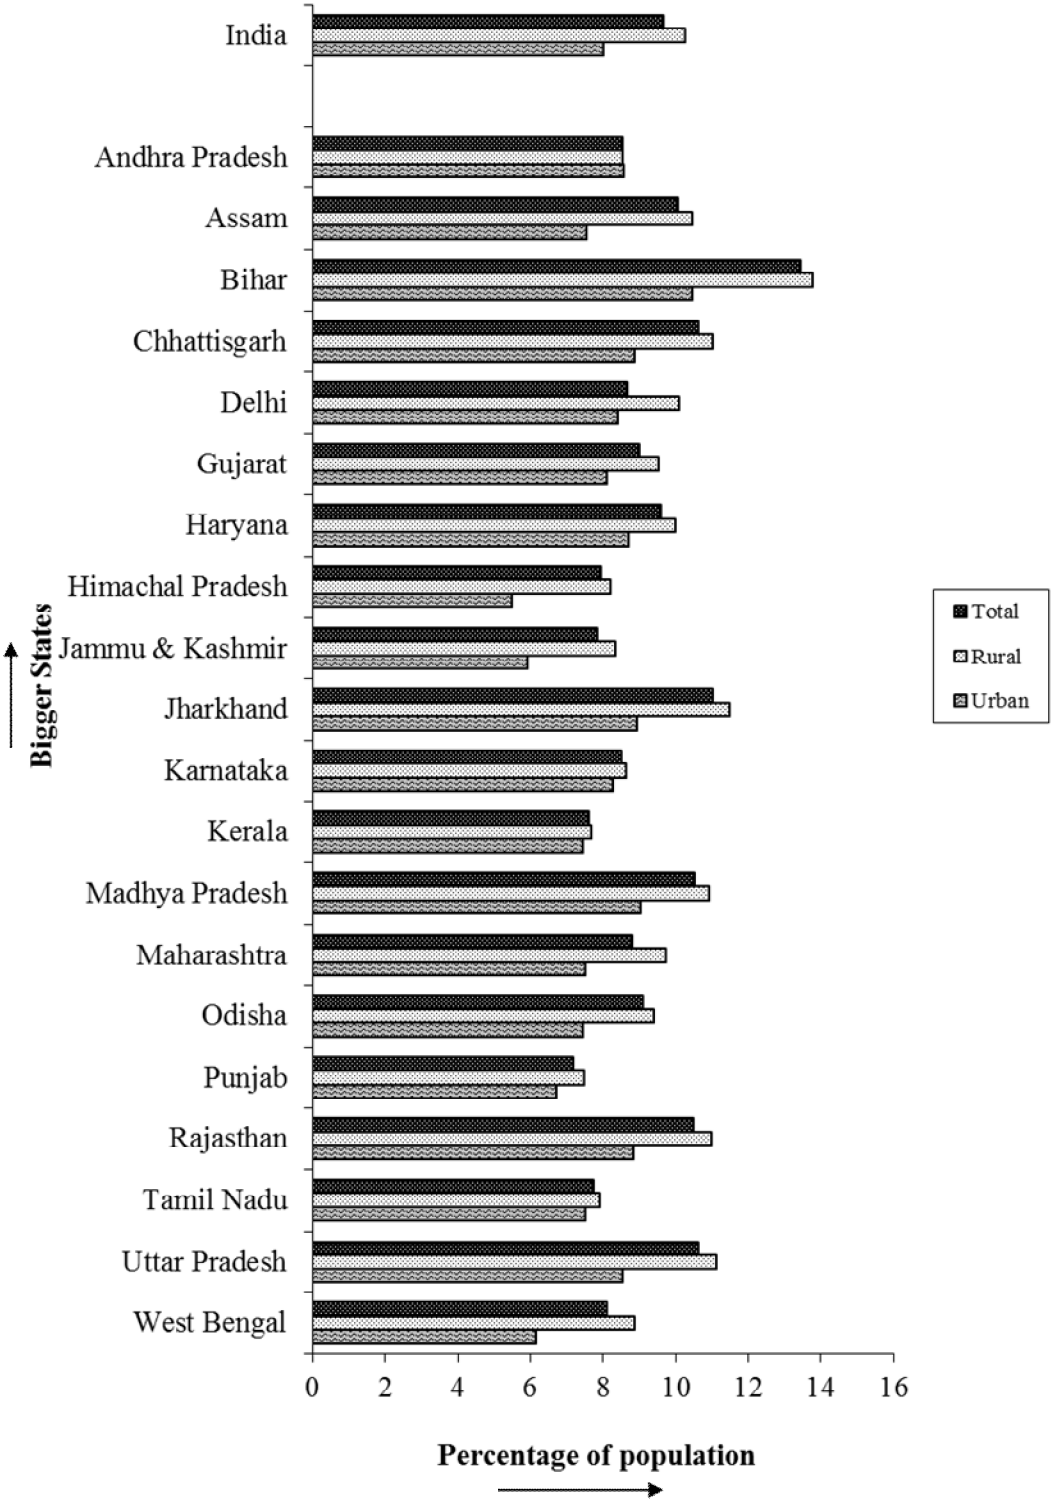

2.5 Percentages share of population in the selected age groups for bigger States by residence and sex are given in Statements 4 to 7. Statement 4 gives the percentage of population below 5 years of age. At the National level, 8.0 percent population in urban areas constitutes below 5 years of age as against 10.3 percent for rural area. Sex differences in the share of child population are negligible both in rural and urban areas. The difference in the share of male child population is maximum (about 1 percent higher) in rural area of Kerala. Among the bigger States, the percentage of child population in rural areas varies from 7.5 in Punjab to 13.8 in Bihar. In urban areas, such variation is from 5.5 in Himachal Pradesh to 10.5 in Bihar. Chart 3 shows the pictorial presentation of percentage of child population for bigger States.

Statement 4

Percentage of population in the age group 0-4 years to total population by sex and residence, India and bigger States, 2012

India and bigger States	Total			Rural			Urban		
	Total	Male	Female	Total	Male	Female	Total	Male	Female

Chart 3 : Percentage of child population (0-4 years) to total population by residence, India and bigger States, 2012

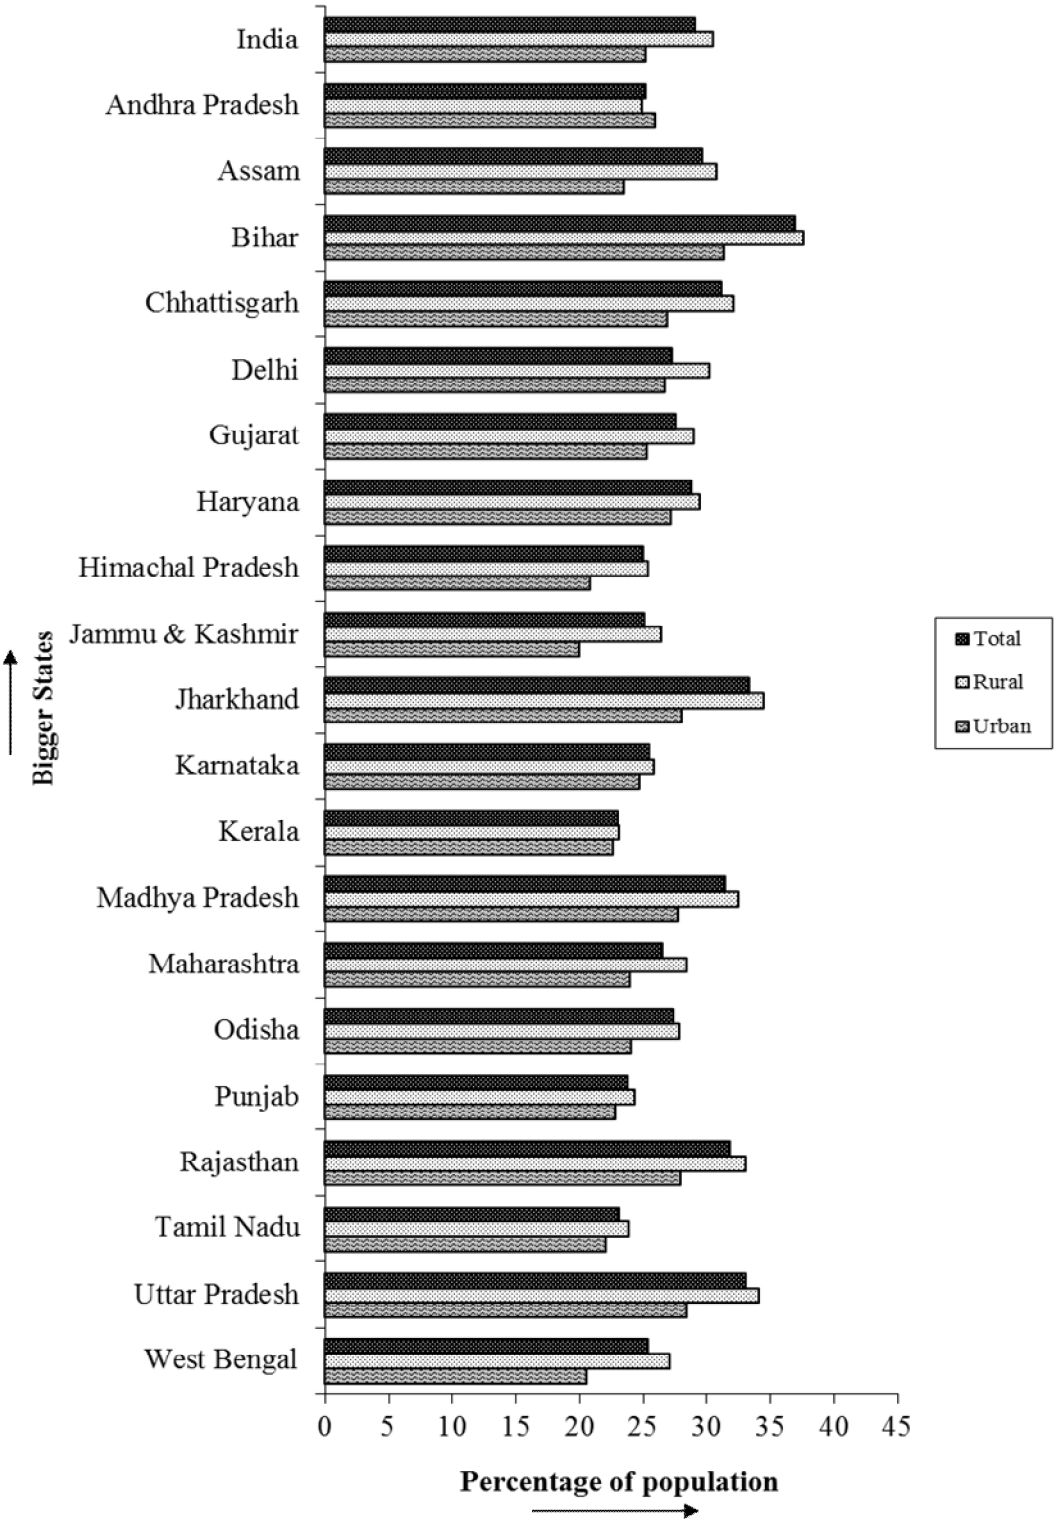

2.6 Percentage of population of age less than 15 years for India and bigger States by sex and residence is given below in Statement 5. At the National level, 30.5 percent of rural population in the year 2012 is below 15 years of age against 25.2 percent for urban areas. Percentage of population below 15 years of age in rural areas varies from 23.2 in Kerala to 37.6 in Bihar. In urban areas, it varies from 20.0 in Jammu & Kashmir to 31.3 in Bihar. Chart 4 gives the pictorial presentation of percentage of persons below 15 years of age for bigger States by residence.

Chart 4: Percentage of population age 0-14 years to total population by residence, India and bigger States, 2012

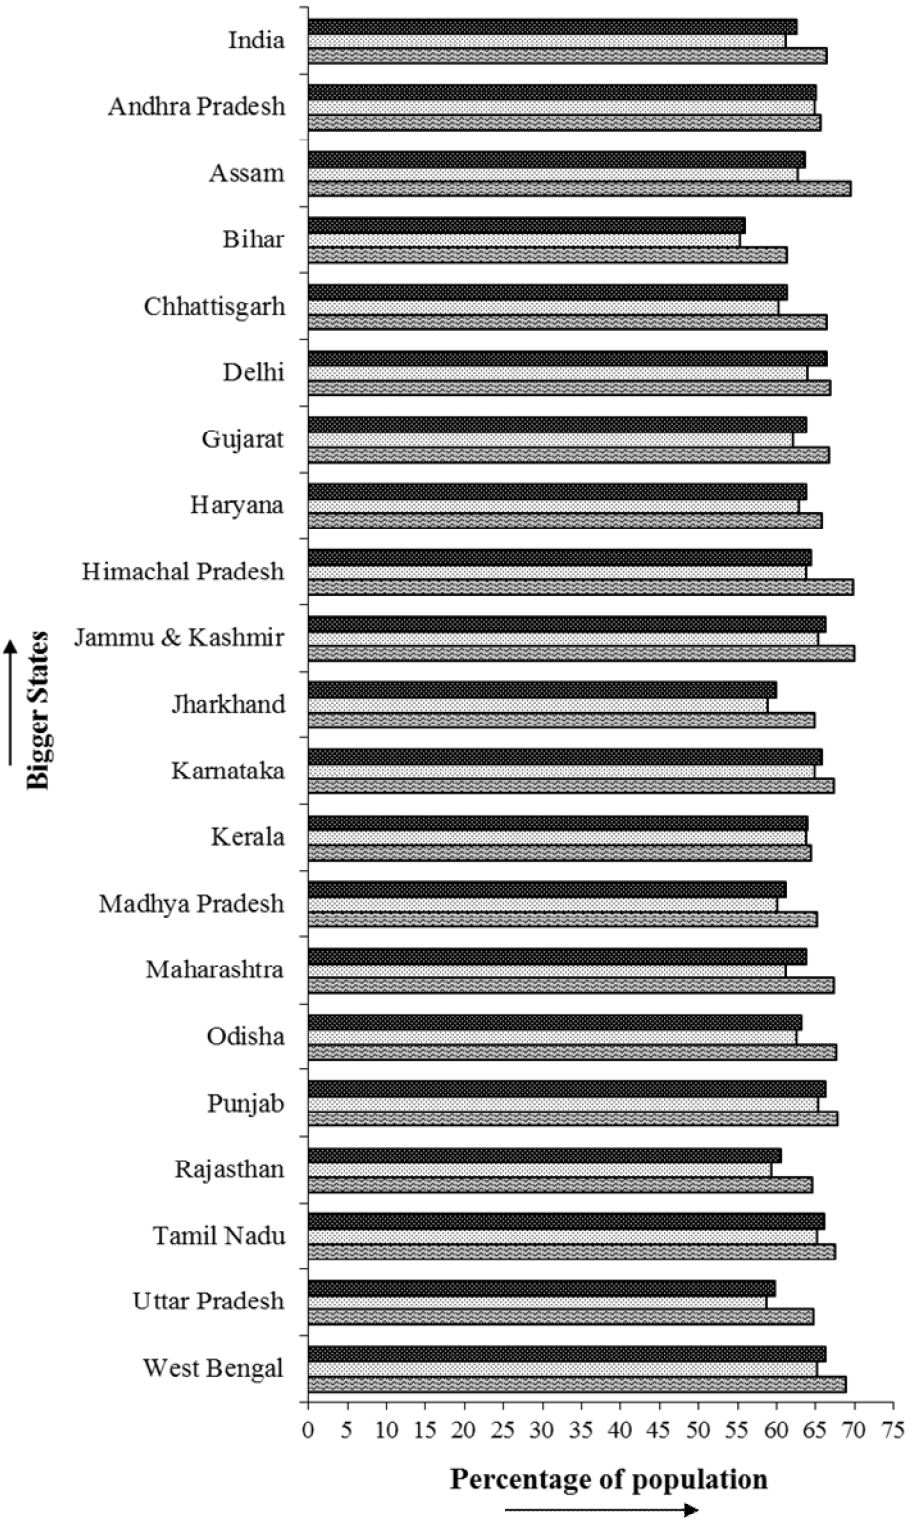

2.7 Statement 6 given below provides percentage of population in the working age group 15-59 years for India and bigger States by sex and residence. At the National level, the age group 15-59 contributes 61.2 percent in rural areas and 66.5 percent population in urban areas. In rural areas the percentage varies from 55.3 in Bihar to 65.4 in Jammu & Kashmir and Punjab. In urban areas the same varies from 61.4 in Bihar to 70.0 percent in Jammu & Kashmir and Himachal Pradesh. Chart 5 gives the pictorial presentation of percentage of population in the age group 15-59 years by residence.

Chart 5: Percentage of population age 15-59 years to total population by residence, India and bigger States, 2012

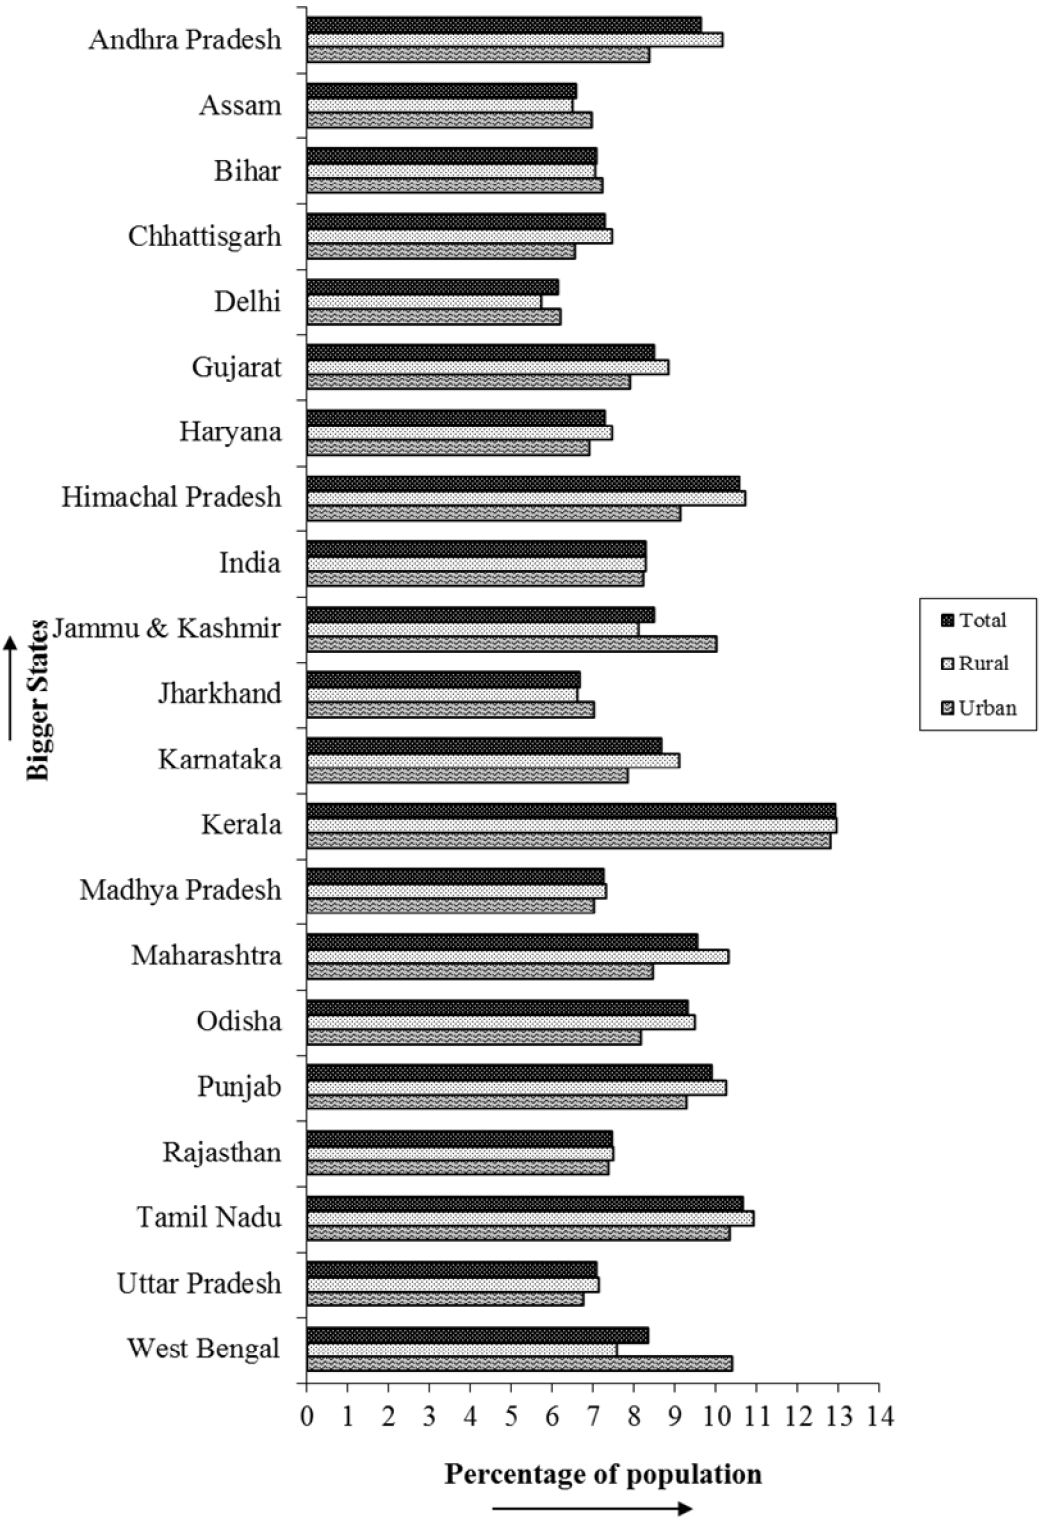

2.8 Percentage of aged persons (60 years and above) for India and bigger States by sex and residence is given below in Statement 7. At the National level, percentage of aged (60+) population is 8.3. Composition of 60+ aged female population is higher in all of the bigger States except Assam, Bihar, Jammu & Kashmir and Jharkhand. In rural areas population in the age group 60+ constitutes 8.3 percent of the total population and variation in aged population ranges from 5.7 percent in Delhi to 13.0 percent in Kerala. The urban proportion of aged population in most of the States is lower than the corresponding rural share except for Assam, Bihar, Delhi, Jammu & Kashmir, Jharkhand, and West Bengal. The Pictorial presentation of percentage of old age population by residence for bigger States is given in Chart 6.

Chart 6: Percentage of population aged 60+ to total population by residence, India and bigger States, 2012

Marital Status

2.9 Besides age, the other important demographic characteristic collected and subsequently updated during each half yearly survey of the SRS is the marital status. Distribution of the population by marital status is thus available from SRS.

2.10 Statement 8 given below shows the percentage distribution of population by sex and marital status for India and bigger States for the year 2012. During this year, 47.8 percent of the population at the National level is reported as never married. Married population constitutes 47.0 percent of the total population whereas widowed/divorced/separated constitutes 5.2 percent. The proportion of W/D/S female population is higher than males at the National level as well as in the bigger States. The gap is significantly wide (more than 10 percentage) in respect of Karnataka, Kerala and Tamil Nadu. Andhra Pradesh (51.8) recorded the highest percentage of married population whereas the lowest was recorded for Uttar Pradesh (41.5). Married Females recorded a higher percentage as compared to Males at the National level and similarly for all of the bigger States. The percentage distribution of population by sex, marital status and age-group for India and bigger States is detailed in Table-2.

W/D/S- Widowed/Divorced/Separated

Note: Total may not add to 100 due to rounding off.

2.11 Persons below 10 years of age, in the SRS, are being treated as unmarried. Marital distribution of population would be more meaningful if such percentages are worked out for persons of age 10 years and above. Statement 9 given below provides percentage distribution of population for age 10 years and above by marital status and sex for India and bigger States. At the National level, the percent share of married population is 57.9. Among the bigger States Jammu & Kashmir (50.6) recorded the lowest percentage of married population whereas the highest percentage was recorded for Andhra Pradesh (61.8).

W/D/S- Widowed/Divorced/Separated

Note: Total may not add to 100 due to rounding off.

2.12 Statement 10 placed below shows the percentage distribution of Female age 10 years and more by marital status and residence. At the National level, 59.8 per cent of such females are married. The proportion of married female is slightly higher in rural areas than that of urban areas in India . However the trend in the States of Assam, Gujarat, Haryana, Jammu & Kashmir, Karnataka, Kerala, Odisha, Rajasthan, Punjab and Tamil Nadu is otherwise. Among the bigger States the lowest percentage of married female is found to be in Jammu & Kashmir (52.7) and the highest in Haryana (63.1). Percentage of never married Female in the bigger States varies from 24.0 in Kerala to 40.2 in Jammu & Kashmir. The percentage of female in the category Widowed/Divorced/Separated varies from 6.2 in Bihar to 15.1 in Tamil Nadu.

Note: Total may not add to 100 due to rounding off.

2.14 In addition to the marital status of male and female, information on the number of females who got effectively married during the reference period of six months of each half yearly survey is also being collected in the SRS from 1990. Based on the information on the number of females, who got effectively married during the last one year, mean age at effective marriage for female has been worked out. Statement 12 given below presents percentage distribution of such females by age at effective marriage separately for rural and urban areas. The percentage of females who got effectively married before reaching 18 years of age is 2.9 at the National level and varies from 0.2 in Jammu & Kashmir to 7.1 in Jharkhand. Percentage of female marrying at 21 years and above is 53.2 at the National level and varies from 37.5 in Chhattisgarh to 88.5 in Jammu & Kashmir. About half of the rural female, at the National level, marry between 18 and 20 years of age compared to about one-third in urban areas.

CHAPTER - 3

ESTIMATES OF FERTILITY INDICATORS

Since inception, SRS has been providing data for estimating various fertility measures. The fertility indicators considered in this chapter are Crude Birth Rate, General Fertility Rate, Age Specific Fertility/Marital Fertility Rates, Total Fertility/Marital Fertility Rates and Gross Reproduction Rate. Apart from this, the chapter includes sex ratio at birth and for the age group 0-4. The data on the sex ratio should enable the readers to gauge the gender disparity at birth and to map the improvements in the age group 0-4. To examine the changes in the levels of fertility during the last decade, the average values of these fertility indicators for the years 2010-12 are compared with that for 2000-02.

3.2 The crude birth rate (CBR) at all India level had declined from 36.9 in 1971 to 33.9 in 1981, registering a fall of about 8 per cent. During 1991-2012, the decline has been about 26.8 per cent from 29.5 to 21.6. The rural-urban differential has also narrowed over these years. However, the CBR has continued to be higher in rural areas compared to urban areas in the last three decades. The total fertility rate (TFR) has declined from 5.2 to 4.5 during 1971 to 1981 and from 3.6 to 2.4 during 1991 to 2012. The TFR in rural areas has declined from 5.4 to 2.6 from 1971 to 2012 whereas the corresponding decline in urban areas has been from 4.1 to 1.8 during the same period. In 2012, around 73 per cent of the deliveries were institutional which includes Government as well as private hospitals. The percentage of institutional deliveries in urban areas is 92.0 as against about 67.9 percent recorded in rural areas.

3.3 The data on most of the fertility indicators has been presented by age, sex and residence for all India and bigger States. It also includes data on fertility by level of education, order of birth, birth interval and medical attention at birth.

3.4 Apart from the fertility indicators at State and National levels, the SRS sample from 2004 onwards also provides estimates of birth rates at sub-State, viz. NSS Natural Division Level in rural areas. NSS natural divisions have been formed taking into consideration the geography of the State and by grouping contiguous districts having similar topography, population density, cropping pattern and rainfall etc. The Table 11 of this report contains data on birth rate besides death and infant mortality rate for 56 Natural Divisions of 16 bigger States. The Table 11 also contains data on birth rate besides death and infant mortality rate for four metro mega cities viz. Chennai, Delhi, Kolkata and Mumbai.

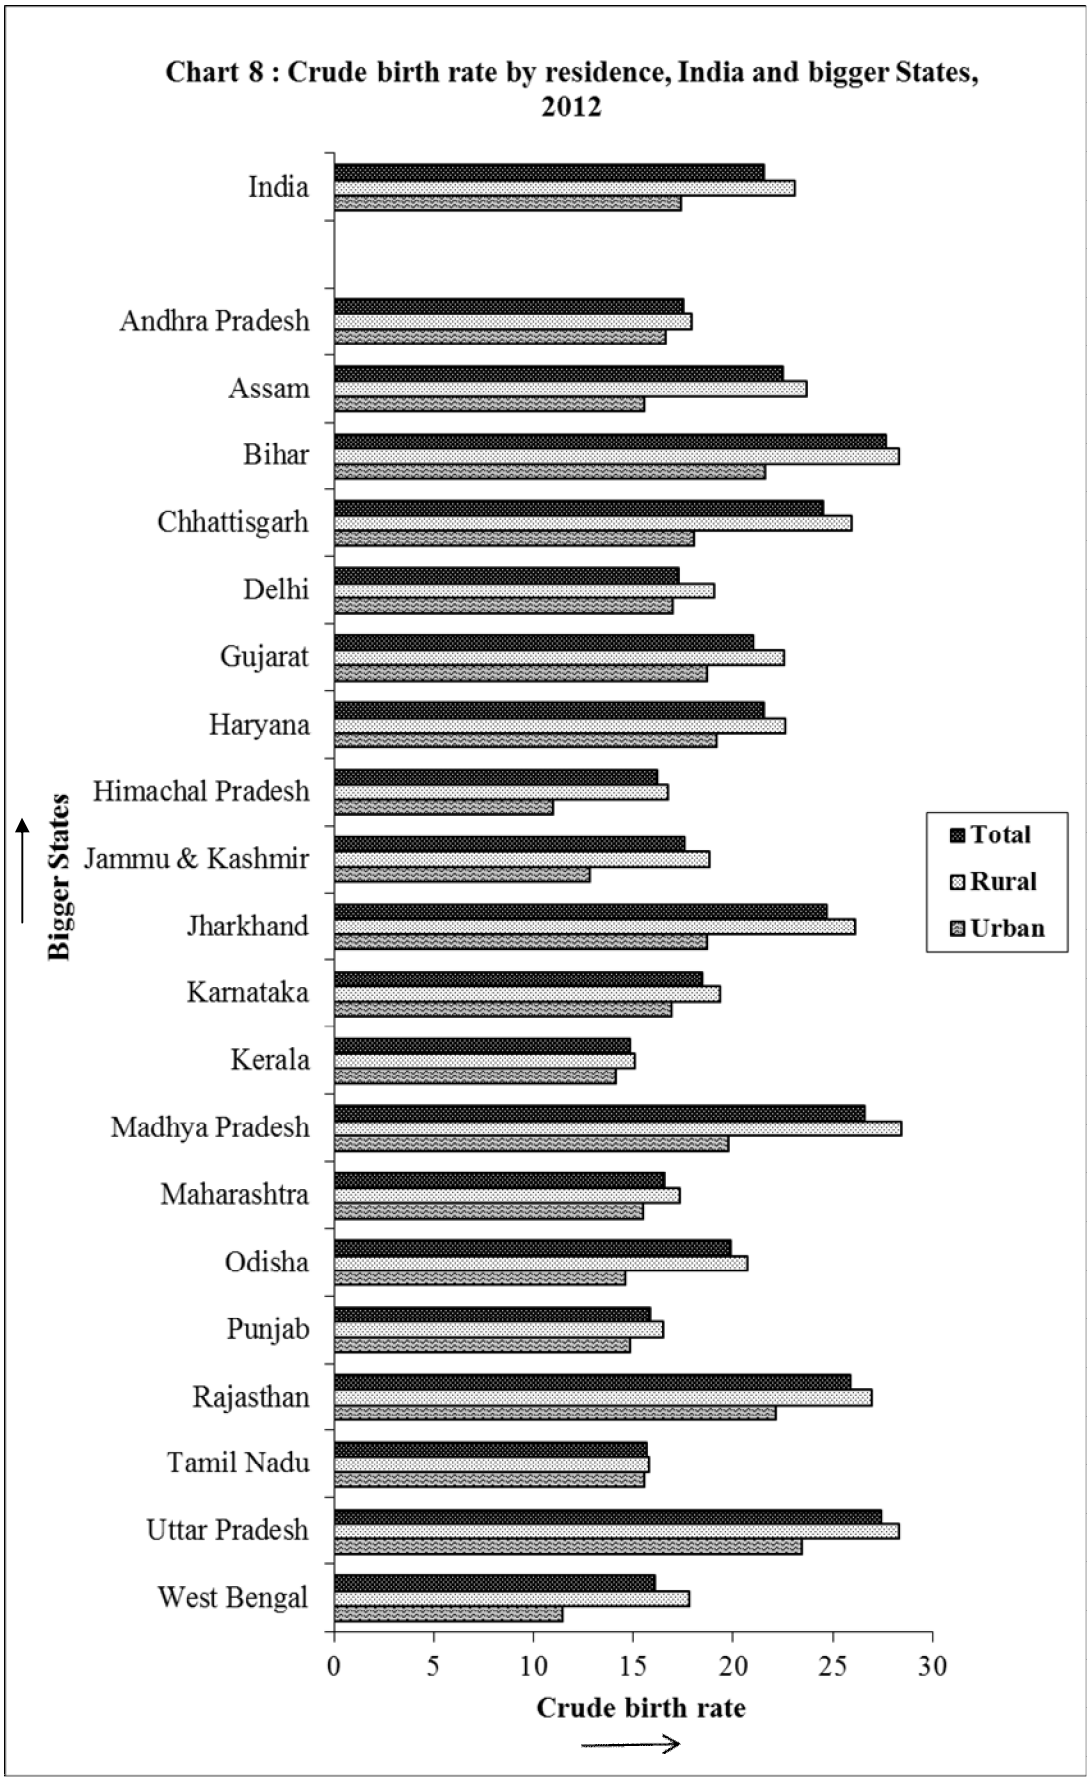

3.5 Based on the figures in the Statement 14 given below, the graphical representation of birth rate of bigger States by residence is depicted in Chart 8 and the distribution of bigger States by levels of birth rate in rural and urban areas is presented in Chart 9. The CBR at national level is 21.6 which varies from 23.1 in rural and 17.4 in urban areas. Andhra Pradesh, Delhi, Himachal Pradesh, Jammu & Kashmir, Karnataka, Kerala, Maharashtra, Punjab, Tamil Nadu and West Bengal are the major States having birth rate below 20 both in rural and urban areas. On the other hand, Madhya Pradesh have the highest birth rate in rural areas (28.5) and Uttar Pradesh has the highest in urban areas (23.5) followed by Rajasthan (22.1). The lowest CBR was recorded in rural areas (15.1) of Kerala and in urban areas (11.0) of Himachal Pradesh.

Statement 14

Chart 8 : Crude birth rate by residence, India and bigger States, 2012

3.6 Statement 15 below provides the percentage change in average crude birth rate between the periods 2000-02 and 2010-12 for India and bigger States separately for rural and urban areas. At the national level, the rate of decline in birth rate is 14.2 per cent. The rate of decline in average birth rate varies from 23.6 per cent in Punjab to 9.6 per cent in Gujarat. Such decline in rural areas is from 23.5 per cent in Punjab to 10.1 per cent in Gujarat. In urban areas, the decline ranges from 33.3 per cent in Himachal Pradesh to 8.9 per cent in Rajasthan. In Kerala and Tamil Nadu, the average crude birth rate in rural areas is nearly same as in the urban areas during 2010-12.

Chart 9: Distribution of bigger states by values of birth rate for rural and urban areas, 2012

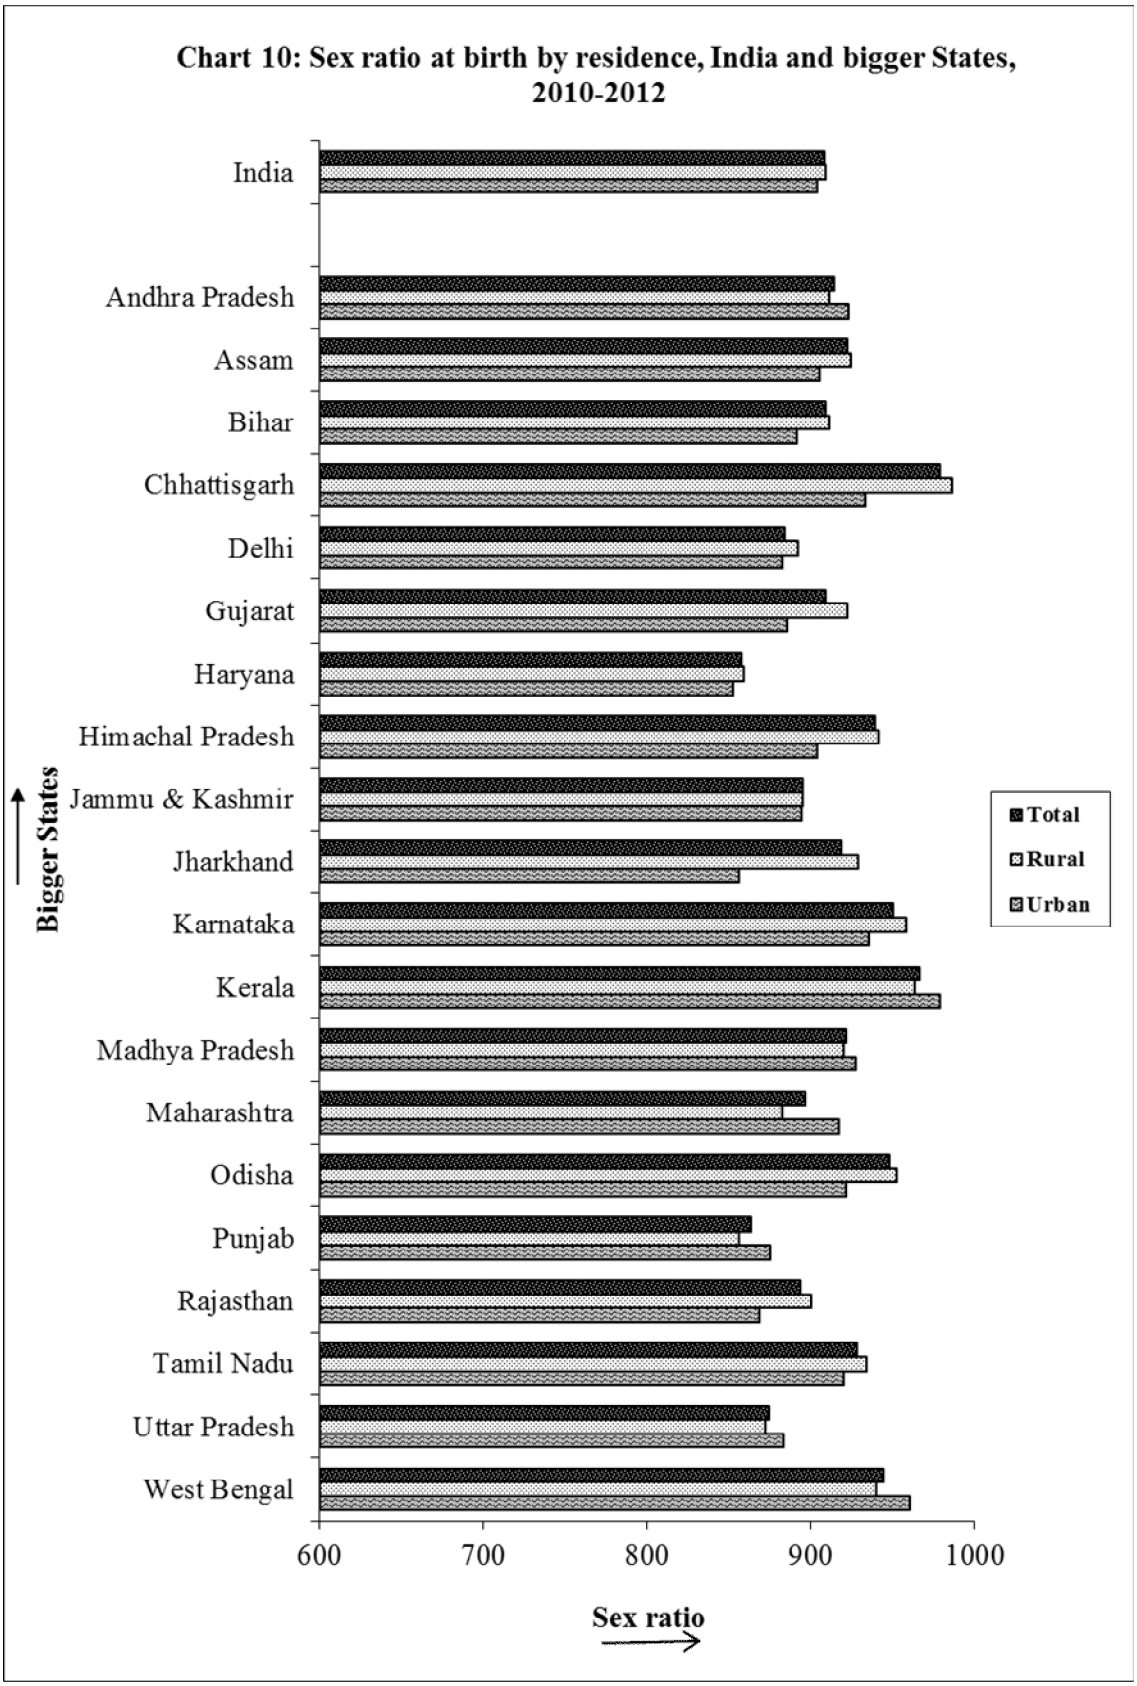

3.7 The Statement 16 below presents sex ratio at birth during the period 2010-12. The sex ratio at birth for the country for the period 2010-12 (3-years average) has been estimated as 908. At National level, it is 909 in rural area and 904 in urban area. Among the bigger States, the sex ratio at birth varies from 979 in Chhattisgarh to 857 in Haryana. In the rural areas, the highest and the lowest sex ratio at birth are in the States of Chhattisgarh (986) and Punjab (856) respectively. The sex ratio in urban areas varies from 979 in Kerala to 852 in Haryana. Chart 10 depicts the variation in sex ratio by residence among bigger States in the country.

Chart 10: Sex ratio at birth by residence, India and bigger States, 2010-2012

3.8 The Statement 17 below presents the sex ratio for the age group 0-4. The sex ratio for the age group 0-4 for all India is 912. It varies from 914 in rural areas to 906 in urban areas. The maximum sex ratio of 1011 has been estimated in Chhattisgarh and the minimum of 837 in Haryana. For rural areas, the minimum sex ratio of 838 has been observed in Haryana and the maximum, 1024 in Chhattisgarh. In the urban areas, the maximum sex ratio is observed in West Bengal (963) and the minimum, in Haryana (834).

Statement 17

Sex ratio of child (age group 0-4), India and bigger States, 2010-2012

India and bigger States	Total	Rural	Urban

3.9 Estimates of General Fertility Rate (GFR), a refined measure of fertility, defined as the number of live births per thousand women in the reproductive age-group 15-49 years, is a useful tool for measuring fertility. The GFR for all-India and bigger States are given below in Statement 18 separately for rural and urban areas. At the national level, 80.3 children were born to every thousand women aged 15-49 years. This number varies from 61.5 in urban areas to 87.6 in rural areas. Among the bigger States, GFR varies from 53.4 in Kerala to 113.5 in Bihar. Chart 11 gives a pictorial comparison of bigger States by level of GFR. The distribution of bigger States by residence and levels of GFR is presented in Chart 12 and from which it is observed that GFR in rural areas of Kerala is just higher than urban areas with the difference of 3.4.

Statement 18

GFR (General fertility rate) by residence, India and bigger States, 2012

India and bigger States	Total	Rural	Urban
India	**80.3**	**87.6**	**61.5**
Andhra Pradesh	62.7	64.6	58.5

Chart 11: GFR by residence, India and bigger States, 2012

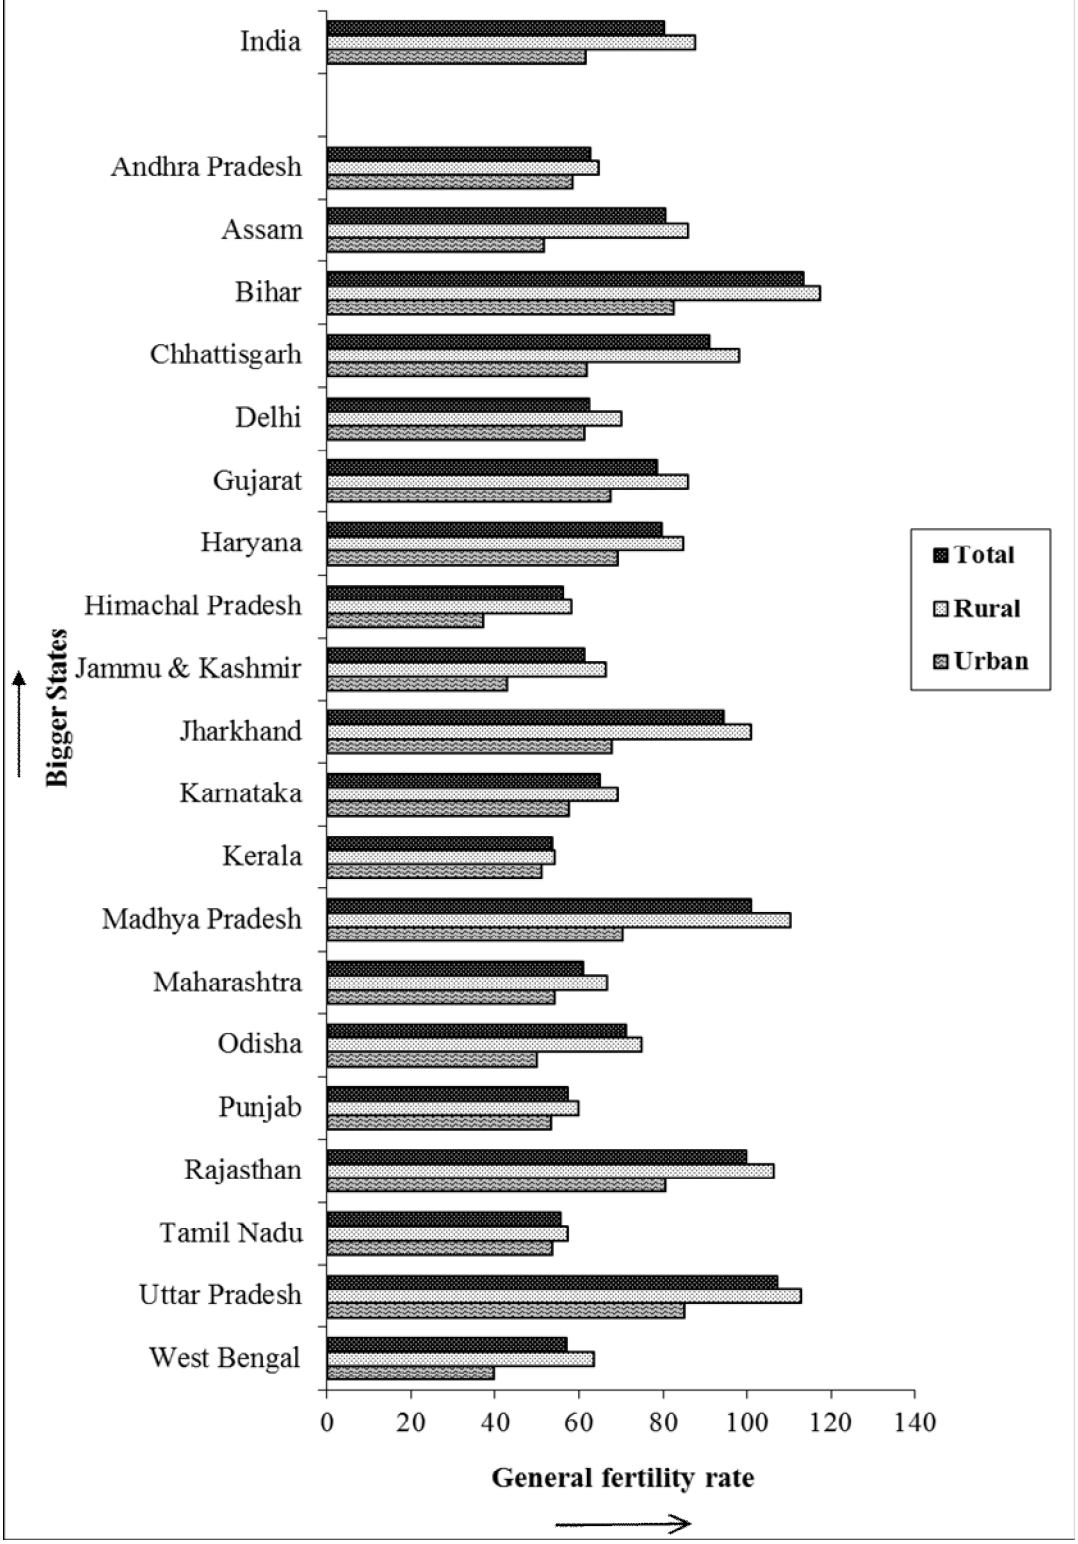

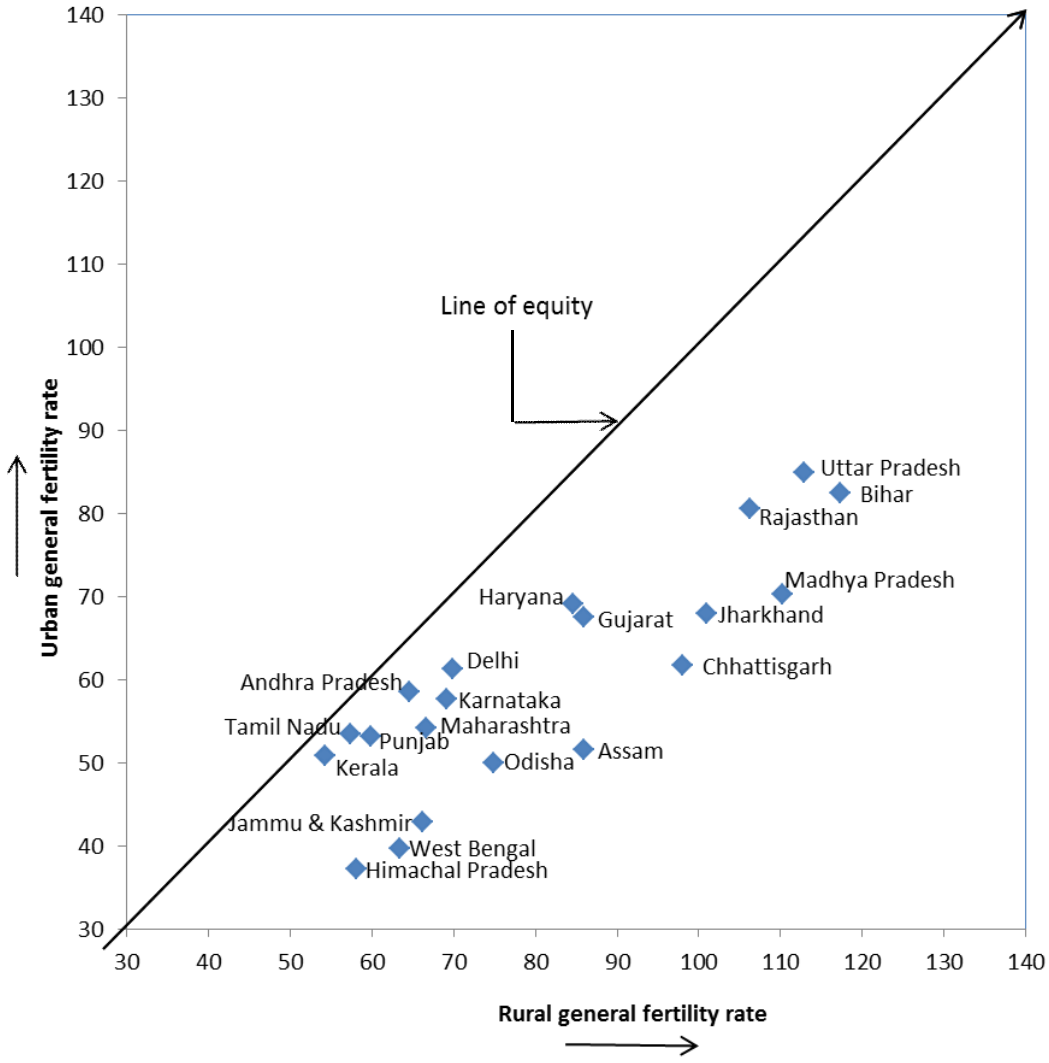

Chart 12: Distribution of bigger states by values of General fertility rate(GFR) for rural and urban areas, 2012

3.10 Changes in the average level of GFR between 2000-2002 and 2010-2012 for India and bigger States are shown below in Statement 19. At the all India level, a decline of 18.0 per cent in GFR has been registered during the decade and it varies from 18.0 per cent in rural to 16.0 per cent in urban areas. Among the bigger States, the percentage decline in GFR varies from 25.5 in Punjab to 10.1 in Kerala.

Statement 19

Percent change in average GFR (General fertility rate) between 2000-02 and 2010-12 by residence, India and bigger States

Fertility by age of women

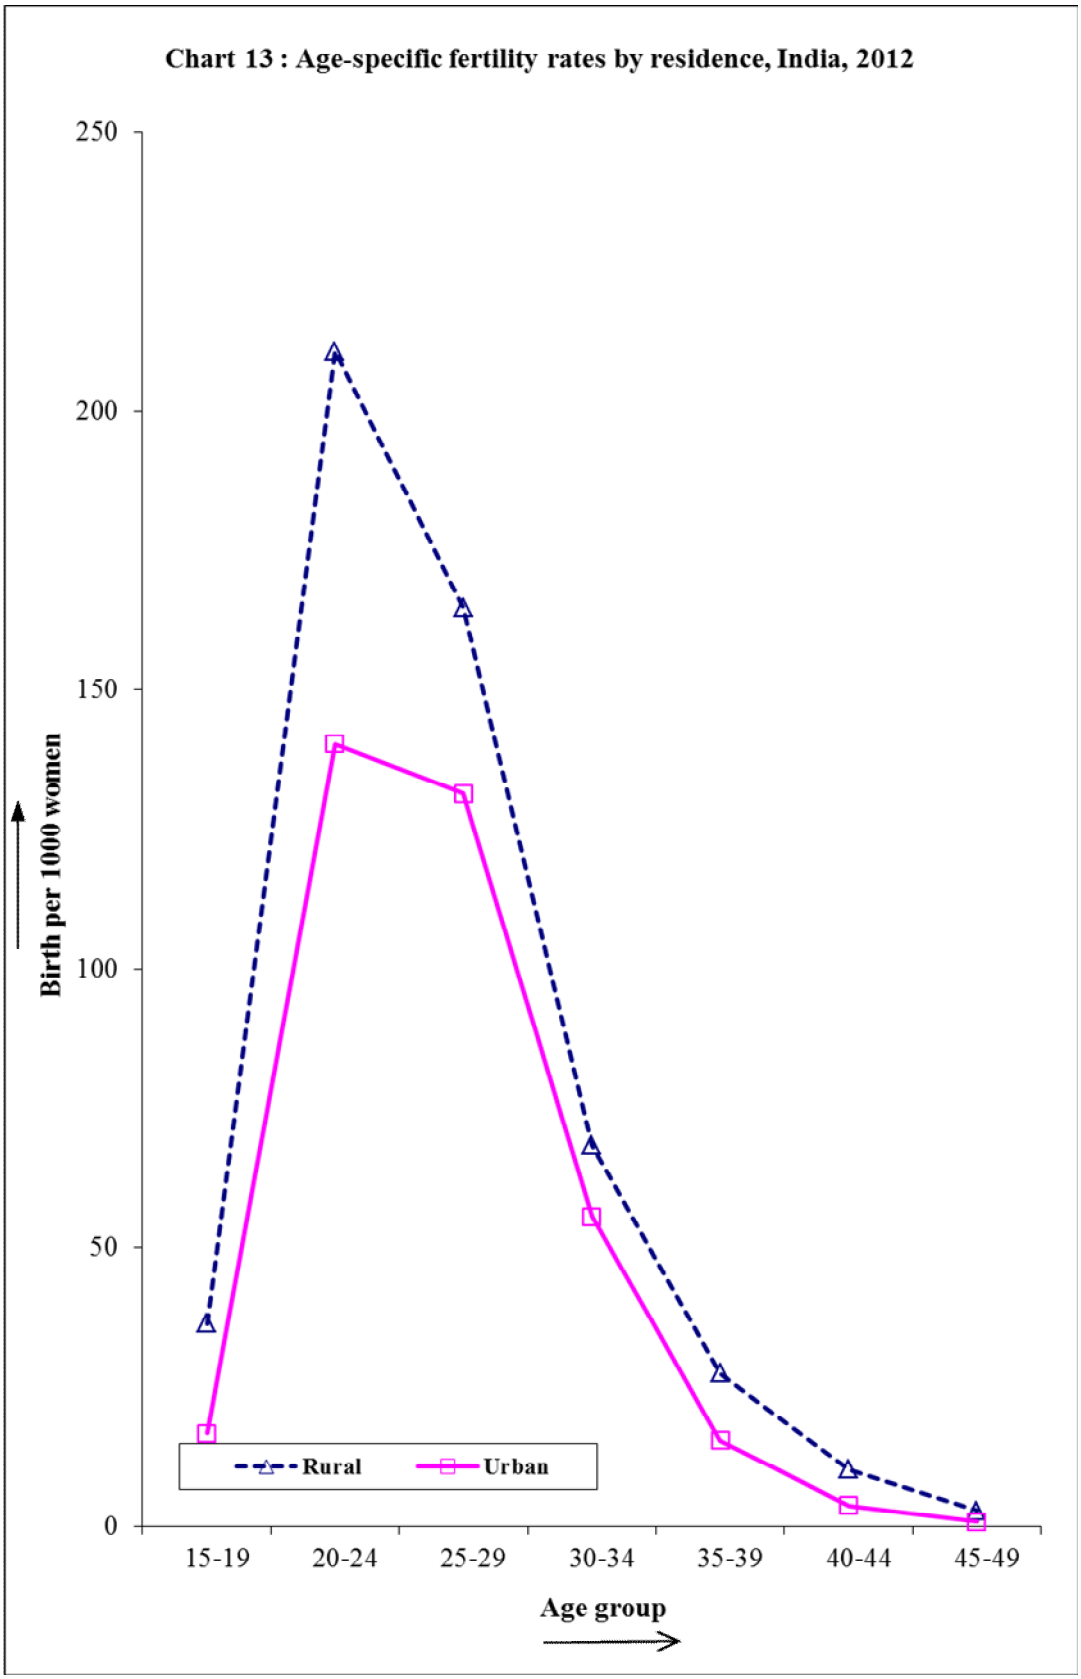

3.11 Age of women is an important factor affecting the fertility levels. On the basis of data on births to women by specific age groups in the reproductive span 15-49 years as available from SRS, age specific fertility rates have been calculated. Statement 20 below presents the age specific fertility rates for India by residence.

3.12 The data reveals that fertility in all the age groups is higher in rural areas than in urban areas. This distribution of age-specific fertility by residence is presented in chart 13. The fertility reaches the peak in the age group 20-24 and declines thereafter, irrespective of the place of residence. ASFR curve for urban areas falls under the ASFR curve of rural areas. Rural ASFR curve has declined very steeply after attaining peak for age 20-24 where as urban ASFR curve has gradually declined up to the age 25-29 after attaining peak at age group 20-24.

Statement 20

ASFRs (Age specific fertility rates) by residence, India, 2012

Age Groups	Total	Rural	Urban
15-19	31.5	36.3	16.7
20-24	191.9	210.6	140.4
25-29	154.6	164.8	131.4

Age group

3.13 The percentage change in age specific fertility rate during the last decade is presented below in Statement 21 separately for rural and urban areas. The data pertains to changes in the age specific fertility rates for the quinquennial age groups based on average value for three years period viz. 2000-02 and 2010-12 for all-India.

3.14 The data reveals that decline in fertility rates is more in urban areas compared to rural areas except in the age groups 25-29, 30-34 and 35-39. The decline is perceptible for the higher age groups 40-49 in urban areas. During the last decade, the fertility declined by 61.1 per cent in the age groups 40-44 in urban areas as compared to 55.7 per cent in rural areas. It is slower in the middle age groups 20-29 for both the areas. The minimum decline of 9.5 per cent has been noticed in the age group 20-24 at National level. The minimum decline of 8.8 percent and 11.9 percent in rural and urban areas respectively has also been noticed in the same age group.

Statement 21

Percent change in age specific fertility rates by residence between 2000-02 and 2010-12, India

Age group	Total			Rural			Urban		
	2000-02	2010-12	% Change	2000-02	2010-12	% Change	2000-02	2010-12	% Change

3.15 The fertility pattern by age groups in different States is presented below in Statement 22. Except for Jammu & Kashmir, Kerala, Punjab and Uttar Pradesh where fertility reached its peak in the age group 25-29, the highest fertility in all the other bigger States has been attained in the age group 20-24. Fertility, however, declines from age 30 in all the bigger States. The ASFR in the younger age group 15-19 varies from 6.2 in Jammu & Kashmir to 59.0 in West Bengal. In the age group 30-34, the variation in the level of ASFR is from 24.9 in Andhra Pradesh to 124.9 in Bihar. The rural-urban levels in ASFR for bigger States are shown in Table 3.

Statement 22

3.16 The percentage distribution of cumulative fertility by woman's age is shown below in Statement 23 for India and bigger States for the year 2012. The cumulative fertility for a specific age group has been worked out by adding the ASFRs up to that age group. The percentage share of fertility by woman in the age group 15-19 varies from 1.7 in Jammu & Kashmir to 16.5 in West Bengal. By the age 34, the percentage share of cumulative fertility varies from 89.5 in Jammu & Kashmir to 98.8 in Andhra Pradesh. The percentage share in cumulative fertility for women by the age 39 years varies from 97.2 in Jammu & Kashmir to 99.8 in Andhra Pradesh. At the national level, less than 2 per cent fertility is from women aged 40 years and above. Chart 14 gives percentage cumulative age specific fertility rate for India by residence.

Statement 23

3.17 The difference in the pattern of child bearing can be measured in term of the mean age of fertility, which describes the age pattern of fertility of synthetic cohort of hypothetical group of women viewed as having, in their lifetime, similar fertility experience recorded in a calendar year. The mean age of fertility has been calculated from the age specific fertility rates. The associated standard deviations are also shown. The States having lower values of standard deviation recorded higher concentration of fertility about the mean age as compared to those with higher values. Statement 24 below shows the mean age of fertility for India and bigger States. At the National level, the mean age of fertility is 26.4 years and varies from 24.3 years in Andhra Pradesh to 29.0 years in Jammu & Kashmir with standard deviation 5.4, 4.1 and 5.7 respectively.

Statement 24

Mean age of fertility and associated standard deviation, India and bigger States, 2012

3.18 The cumulative value of the age specific fertility rates at the end of the child bearing ages gives a measure of fertility known as Total Fertility Rate (TFR). TFR indicates the average number of children expected to be born per woman during her entire span of reproductive period assuming that the age specific fertility rates, to which she is exposed to, continue to be the same and that there is no mortality. The TFRs worked out on the basis of the ASFRs for the year 2012 are given below in Statement 25 for India and bigger States separately for rural and urban areas. The TFR for India in the year 2012 was 2.4 per woman and varies from 2.6 in rural areas to 1.8 in urban areas. Among the bigger States, it varies from 1.7 in Himachal Pradesh, Punjab, Tamil Nadu and West Bengal to 3.5 in Bihar. For rural areas, it varies from 1.7 in Himachal Pradesh, Punjab and Tamil Nadu to 3.6 in Bihar. For urban areas, such variation is from 1.2 in Himachal Pradesh and West Bengal to 2.5 in Bihar and Uttar Pradesh. Chart 15 presents levels of TFR by residence for India and bigger States, 2012. Distribution of bigger States by level of TFR in rural and urban areas is shown in Chart 16.

Statement 25

TFR (Total fertility rate) by residence, India and bigger States, 2012

India and bigger States	Total	Rural	Urban
India	**2.4**	**2.6**	**1.8**
Andhra Pradesh	1.8	1.9	1.7
Assam	2.4	2.5	1.5
Bihar	3.5	3.6	2.5
Chhattisgarh	2.7	2.9	1.8
Delhi	1.8	1.9	1.8
Gujarat	2.3	2.5	2.0
Haryana	2.3	2.4	2.0
Himachal Pradesh	1.7	1.7	1.2
Jammu & Kashmir	1.9	2.0	1.3

Note : Rounded off to one decimal point.

Chart 15: Total fertility rate by residence, India and bigger States, 2012

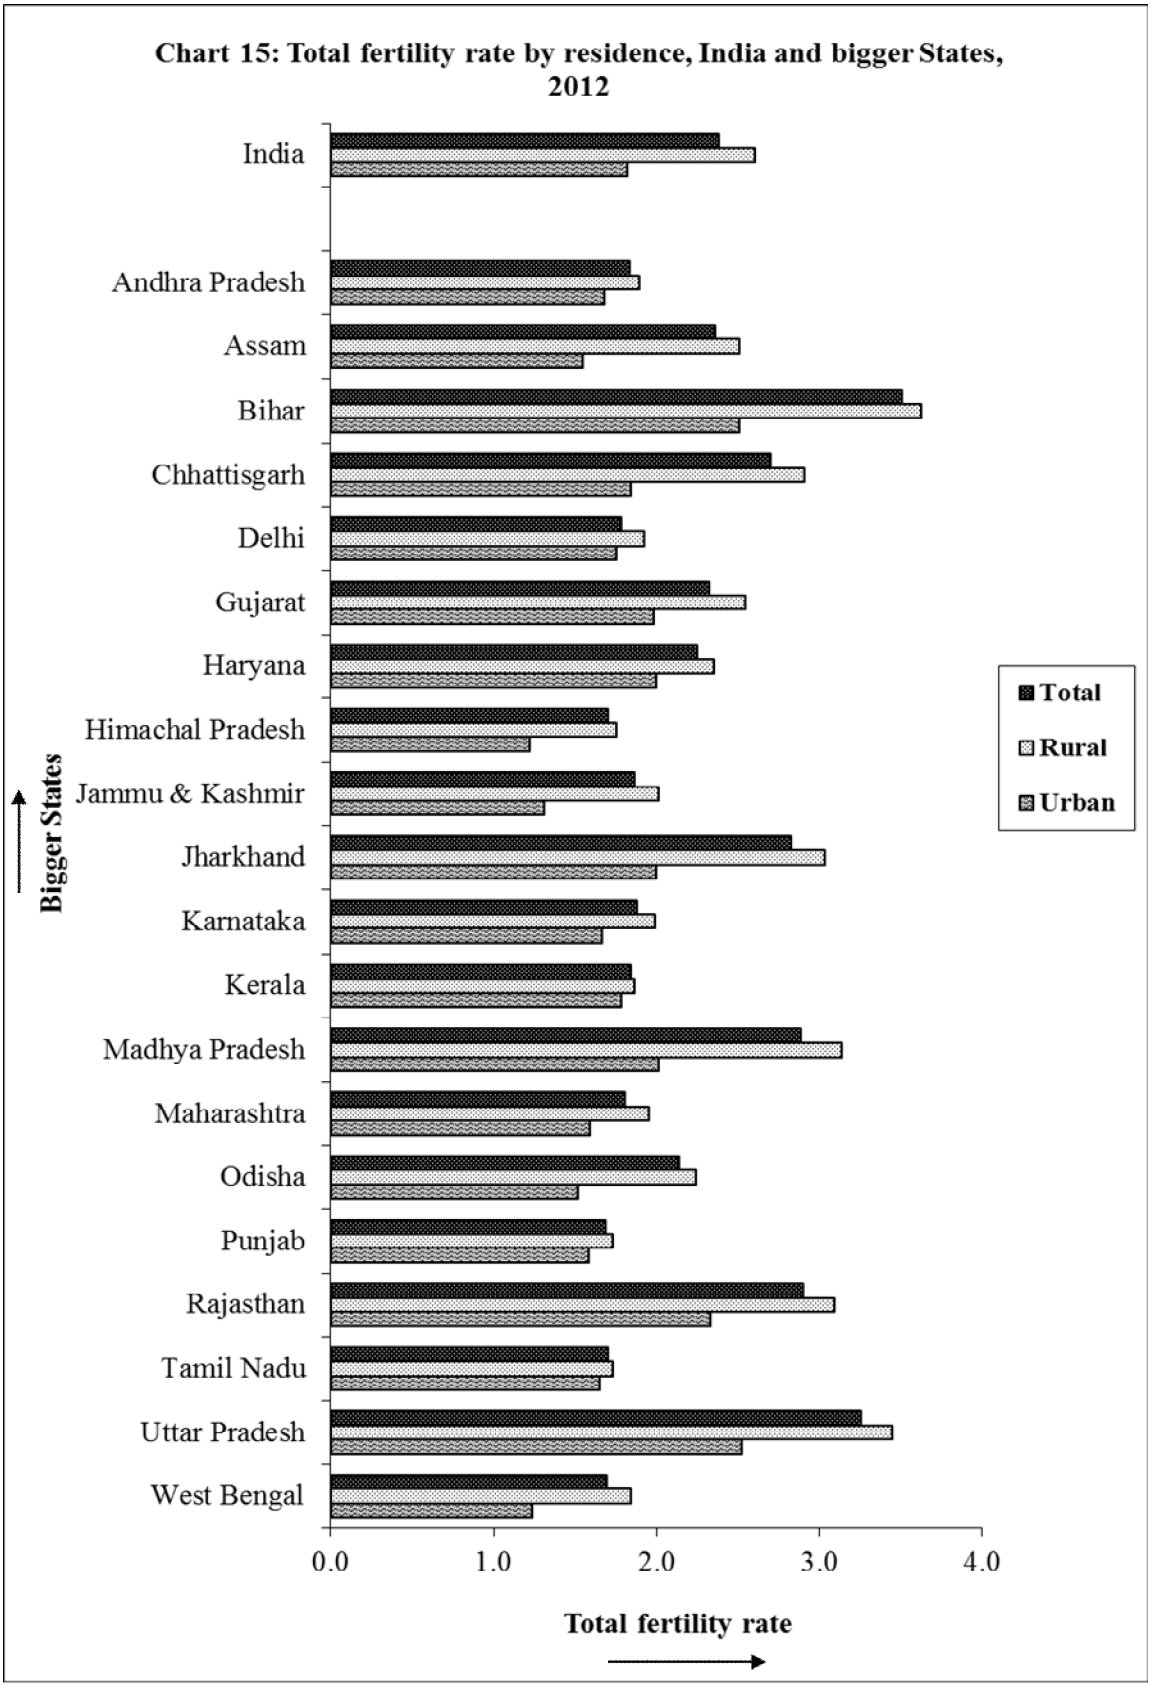

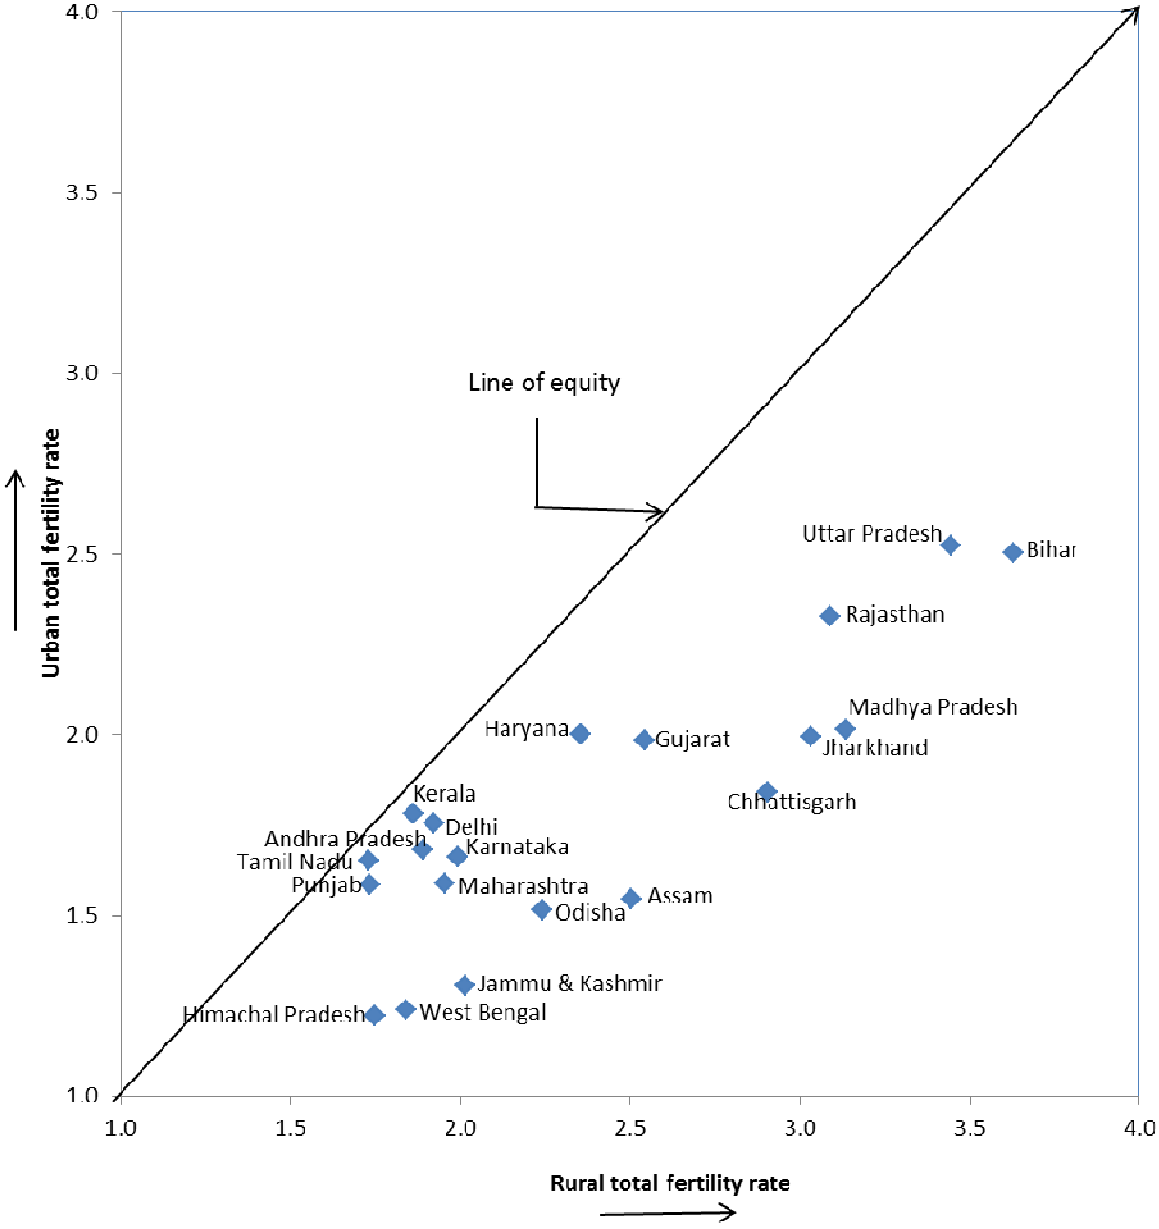

Chart 16: Distribution of bigger states by values of TFR (total fertility rate) for rural and urban areas, 2012

3.19 Statement 26 below presents the percentage change in the average level of TFR between the periods 2000-02 and 2010-12 in India and bigger States. During the period TFR has declined by 22.6 percent at the National level. Among the bigger States, the decline varies from 29.2 percent in Punjab and West Bengal to nil in Kerala. All bigger States have shown decline in both rural and urban areas except in Kerala.

3.20 Among bigger States, Andhra Pradesh, Himachal Pradesh, Karnataka, Kerala, Maharashtra, Punjab, Tamil Nadu and West Bengal has the average TFR below 2.0 during 2010-12.

Statement 26

Percent change in average TFR (Total fertility rate) between 2000-02 and 2010-12 by residence, India and bigger States

***** Bihar, Madhya Pradesh and Uttar Pradesh include Jharkhand, Chhattisgarh, and Uttarakhand respectively.

3.21 Another refined measure of fertility which accounts for future mothers is the Gross Reproduction Rate (GRR). It measures the average number of female children a woman is expected to give birth during her entire reproductive span conforming to the age specific fertility rates (ASFRs) for a given year, if there is no mortality. The estimated value of GRR for India in the year 2012 is 1.1 and varies from 0.8 in urban areas to 1.2 in rural areas. Values of GRR by residence for India and bigger States for the year 2012 are presented below in Statement 27.

Statement 27

GRR (Gross reproduction rate) by residence, India and bigger States, 2012

India and bigger States	Total	Rural	Urban
India	**1.1**	**1.2**	**0.8**
Andhra Pradesh	0.9	0.9	0.8
Assam	1.1	1.1	0.7

Marital Fertility

3.22 Marriage is an important event in the social life of any population. In India, population censuses and large scale demographic sample surveys invariably collect data on the marital status of population separately for males and females. Age at effective marriage of females is a key factor that influences fertility. Marital distribution of the population enumerated through SRS and the age at effective marriage of females has been discussed in Chapter 2. Based on the distribution of live births by age of married females, age specific marital fertility rates (ASMFRs) are calculated. Statement 28 below provides the estimates of the ASMFRs for India separately for rural and urban areas for the year 2012. Marital fertility is higher in rural areas than in urban areas in all the age groups and its peak is in the age group 20-24 years. A perceptible decline in marital fertility is seen for female age 30 years and above both in rural and urban areas.

Statement 28

ASMFRs (Age specific marital fertility rates) by residence, India, 2012

(Per thousand)

Age group	Total	Rural	Urban
15-19	268.2	273.8	235.3
20-24	322.0	329.0	296.2
25-29	180.9	187.2	165.0
30-34	69.4	72.9	60.9
35-39	25.8	29.4	16.7
40-44	9.1	11.2	4.1
45-49	2.5	3.2	0.9

3.23 Values of the age specific marital fertility rates for the year 2012 in bigger States are given below in Statement 29. It is observed that the age pattern of marital fertility is almost similar to the pattern of age specific fertility. The marital fertility in the age group 15-19 is lesser than national average in Andhra Pradesh, Chhattisgarh, Delhi, Haryana, Karnataka, Maharashtra and Rajasthan. ASMFR is at peak level in the age group 20-24 in all the bigger States except Assam, Himachal Pradesh, Jammu & Kashmir, Jharkhand, Kerala, Odisha, Tamil Nadu and West Bengal. There is significant decline in marital fertility for women aged 30 years onwards, for all major States.

Statement 29

ASMFRs (Age specific marital fertility rates), India and bigger States, 2012

India and bigger States	15-19	20-24	25-29	30-34	35-39	40-44	45-49

West Bengal	309.4	220.6	99.3	36.8	12.4	2.2	1.0

3.24 Like TFR, Total Marital Fertility Rate (TMFR) is the cumulative value of age specific marital fertility rates at the end of the reproductive period. It indicates the average number of children expected to be born per married woman during the entire span of her reproductive period, if the ASMFRs continue to be the same and if there is no mortality. The TMFRs worked out on the basis of ASMFRs for the year 2012 are given below in Statement 30 for India and bigger States separately for rural and urban areas. The TMFR for India is found to be 4.4 and varies from 3.9 in urban areas to 4.5 in rural areas. The TMFR is 5 and above in the States of Assam, Bihar, Himachal Pradesh, Jammu & Kashmir, Jharkhand and Uttar Pradesh.

Statement 30

TMFRs (Total marital fertility rates) by residence, India and bigger States, 2012

India and bigger States	Total	Rural	Urban
India	**4.4**	**4.5**	**3.9**
Andhra Pradesh	3.5	3.6	3.2
Assam	5.1	5.2	4.2
Bihar	5.4	5.5	4.6
Chhattisgarh	4.3	4.4	3.7
Delhi	3.7	3.5	3.7
Gujarat	4.3	4.6	3.8
Haryana	3.8	3.8	4.0

Maharashtra	2.9	2.7	3.6
Odisha	4.4	4.5	3.6
Punjab	4.3	4.4	3.9
Rajasthan	4.3	4.4	4.1
Tamil Nadu	4.0	3.9	4.2
Uttar Pradesh	5.9	6.0	5.7
West Bengal	3.4	3.5	2.9

3.25 Statement 31 below presents the percentage change in the average level of TMFR between the period 2000-02 and 2010-12 in India and bigger States. During the period TMFR has declined by 8.5 per cent at the National level. Among the bigger States, the percentage change varies from (-) 21.1 in Maharashtra to 16.7 in Himachal Pradesh. Assam, Haryana, Karnataka, Maharashtra, Punjab, Rajasthan and West Bengal have shown substantial (more than 10 percentage) decline in rural areas. In urban areas, Maharashtra has shown a decline of 19.5 percent followed by Haryana and Odisha with 18.2 and 17.8 percent, respectively.

Statement 31

Percentage change in average Total marital fertility rate (TMFR) between 2000-02 and 2010-12, by residence, India and bigger States

Fertility by level of education of the women

3.26 Education, more precisely the female education, has a direct impact on fertility. To ascertain levels of fertility by educational status of the women three indicators viz. general fertility rate, age-specific fertility rate and total fertility rate by educational status of the women have been worked out separately for rural and urban areas. These are discussed in the subsequent paragraphs.

3.27 Statement 32 below indicates the percentage of female population in the age group 15-49 by level of education, at the National level and for the bigger States. At the National level, 30.1 per cent of the female population is reported 'Illiterate' as against 69.9 per cent in the 'Literate' category. Of the literate women, about 81.8 per cent have education up to Class X, 10.7 per cent women have education level of Class XII, and only 7.4 per cent have reported education level of graduate and above. Among the illiterates, Kerala (1.2) has the lowest and Bihar (49.3) the highest percentage of illiterate women.

Statement 32

Percentage female population in the age group 15-49 by level of education, India and bigger States, 2012

India and bigger States	Educational level of women								
	Illiterate	Literate							
		Total literate	Without any formal education	Below primary	Primary	Middle	Class X	Class XII	Graduate and above
India	**30.1**	**69.9**	**2.1**	**8.9**	**12.4**	**19.7**	**14.1**	**7.5**	**5.2**

West Bengal	24.2	75.8	4.1	11.1	16.4	24.9	10.2	4.3	4.7

3.28 Statement 33 below presents the estimates of General Fertility Rate (GFR) by educational status of the women for India and bigger States. It is apparent from the Statement that there is a difference between the GFRs of the Illiterate and Literate women with the latter depicting substantially lower levels of GFR, both at the National and State level. Lower values of GFR for illiterate women as compared to literate for Andhra Pradesh, Chhattisgarh, Gujarat, Haryana, Himachal Pradesh, Karnataka, Kerala, Madhya Pradesh, Maharashtra, Odisha, Punjab, Tamil Nadu and West Bengal are due to small sample size in illiterate category as literacy level is significantly high in all these States.

Statement 33

General fertility rate by level of education of women, India and bigger States, 2012

India and bigger States	Educational level of women								
	Illiterate	Literate							
		Total literate	Without any formal education	Below primary	Primary	Middle	Class X	Class XII	Graduate and above
India	**83.0**	**79.1**	**92.6**	**101.2**	**89.7**	**77.0**	**65.4**	**65.7**	**74.7**

West Bengal	40.0	62.2	34.1	87.2	76.8	54.9	54.5	48.6	45.2

3.29 Statement 34 below presents, at the National level, age specific fertility rates by level of education of women separately for rural and urban areas. The data reveals marked rural-urban differences with the rural areas generally reporting higher levels of fertility than the urban areas for all age groups. Fertility attains the peak in the age-group 20-24 years both in the rural and urban areas except for the women having education level 12th and above. 'Illiterate' women have higher levels of age-specific fertility rates both in the rural and urban areas than the 'Literate'. Within the 'Literate' group there is a general decline in the fertility rates with the increase in the educational status both in the rural and urban areas, barring a few exceptions.

Statement 34

Age specific fertility rate by level of education of women and residence, India, 2012

3.30 Total fertility rates by education levels of the women for India and bigger States are presented below in Statement 35. At the National level, total fertility rate for the women having educational status 'Illiterate' for 2012 is 3.2. This is much higher than the 'Literate' group of women. Among the 'Literate' (2.1), there is a gradual decline of TFR with the increase in the level of education. Chart 17 presents, at the National level, total fertility rate by level of education of women separately for rural and urban areas for the year 2012. The TFR by levels of education of the women for India and bigger States by place of residence are given in Table-4.

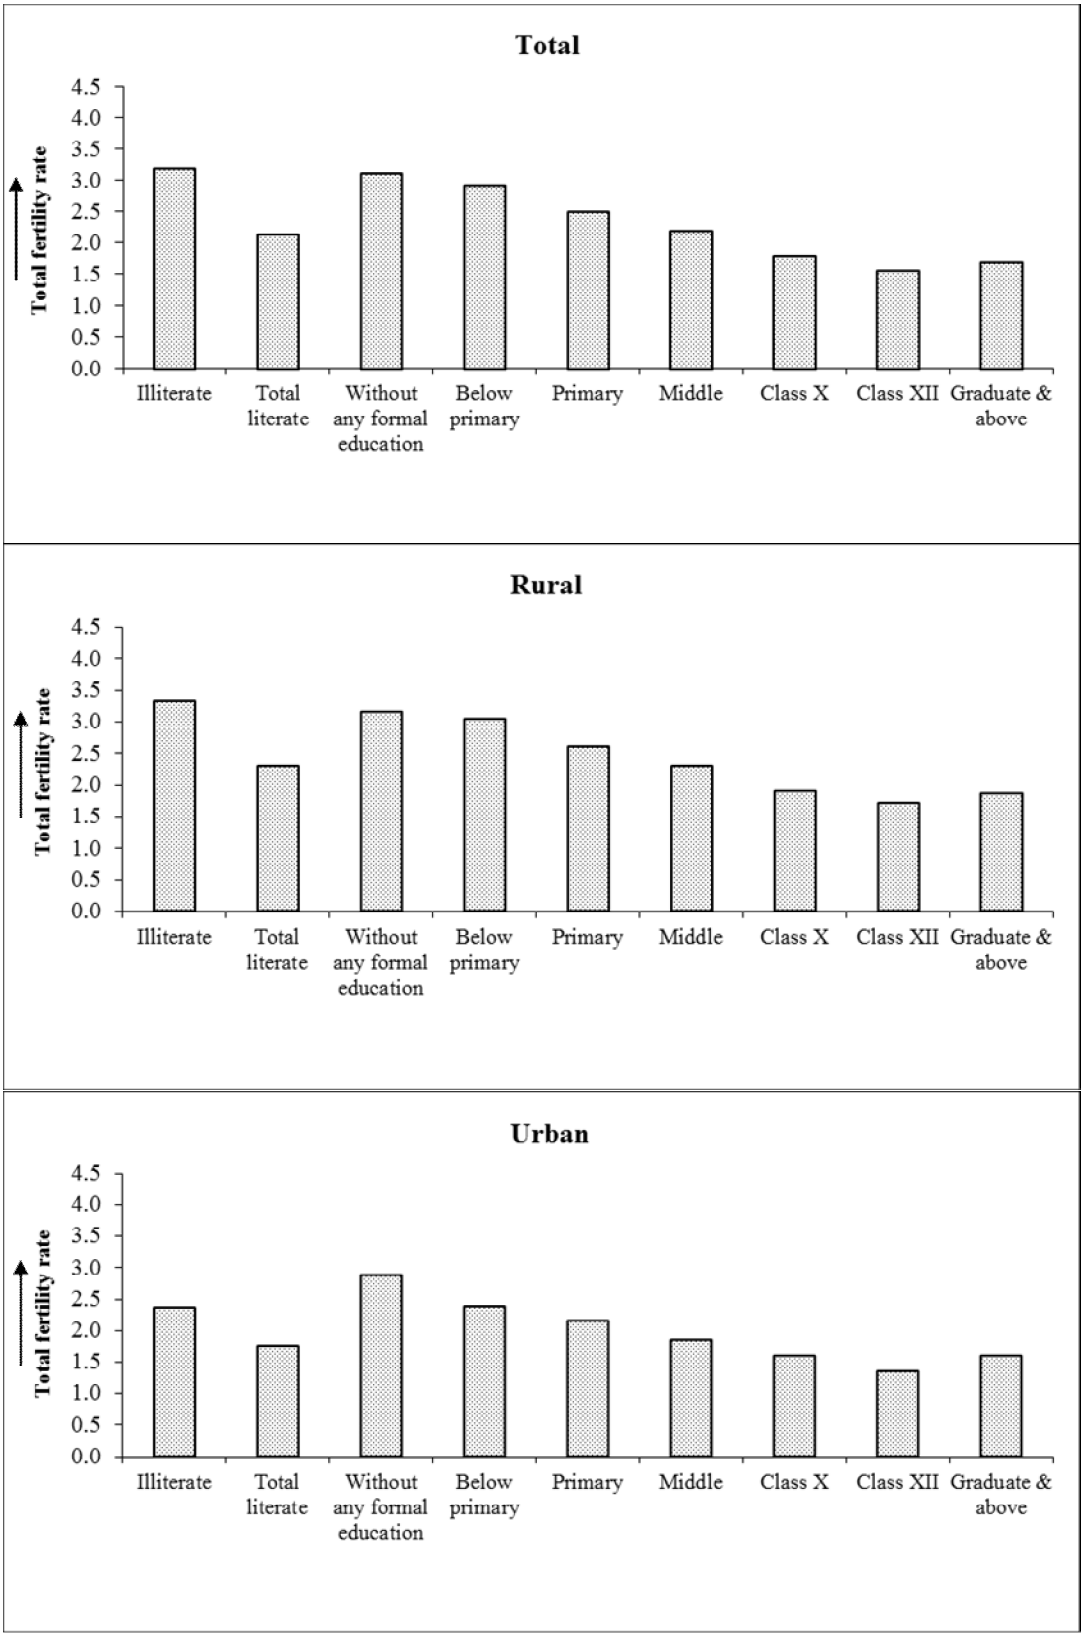

Statement 35

Total fertility rate by level of education of women, India and bigger States, 2012

India and Bigger States	Educational level of women

Chart 17: Total fertility rate by level of education of women and residence, India, 2012

Birth order

3.31 Information on order of the live birth and interval between current and previous live births are also collected in SRS from 1990 onwards. These provide useful information on spacing of children and level of fertility. The estimated percentages on order of live birth and birth interval for India and bigger States are given in Tables 5, 6 and 7. Based on these tables, two State-wise comparative Statements are presented below.

3.32 The percentage distribution of live births by birth order for India and bigger States for the year 2012 is presented below in Statement 36. It is observed 43.2 percent of the current live births in India are first order births, and 31.4 percent of total births are second order births. The fourth and higher order births account for 11.6 percent of the total births. Among the bigger States, the percentage share of first order birth varies from 34.4 percent in Bihar to 57.3 percent in Punjab. On the other hand, the percentage share of fourth and higher order births varies from 1.6 percent in Tamil Nadu to 22.0 percent in Bihar.

Statement 36

Percentage distribution of current live births by birth order, India and bigger States, 2012

India and bigger States	Birth order			
	1st	2nd	3rd	4th & above
India	**43.2**	**31.4**	**13.8**	**11.6**
Andhra Pradesh	50.3	39.7	8.1	1.8
Assam	49.7	27.1	11.4	11.7
Bihar	34.4	25.6	17.9	22.0
Chhattisgarh	43.1	32.2	16.2	8.6
Delhi	48.7	29.2	13.4	8.7
Gujarat	46.7	30.9	12.9	9.5
Haryana	45.5	33.5	13.2	7.8
Himachal Pradesh	52.2	37.1	7.3	3.4

West Bengal	54.9	30.4	8.8	5.9

3.33 Statement 37 below presents the percentage distribution of current live birth by birth order and residence for India and bigger States. It may be observed that the percentage of current live births for 'first' and 'second' order taken together is generally higher for urban areas if compared to the rural areas for bigger States except for Andhra Pradesh, Delhi, Himachal Pradesh, and Punjab. For 'third', 'fourth & above' order live births, the percentage contribution at National level is significantly higher in rural areas (27.6) compared to urban areas (17.6).

Statement 37

Percentage distribution of current live births by birth order and residence, India and bigger States, 2012

India and bigger States	Birth order

Birth interval

3.34 The percentage distribution of second and higher order live births by interval between current and previous live birth is shown below in Statement 38 for India and bigger States for the year 2012. At the National level, 1.5 per cent of the live births occur within one year from the previous live birth. Such percentage varies from 0.2 in Kerala to 2.8 in Punjab. The percentage of births beyond three years of birth interval from the previous live birth for India is 42.6. It varies from 35.4 in Madhya Pradesh to 66.1 in Kerala.

Statement 38

Percentage distribution of second and higher order live births by interval, India and bigger States, 2012

India and bigger States	Interval between current and previous live birth (in months)			
	10-12	12-24	24-36	36+
India	**1.5**	**26.6**	**29.3**	**42.6**

West Bengal	0.7	17.2	23.1	59.0

3.35 Statement 39 below presents the percentage distribution of second and higher order live births by interval between current and previous live birth separately for rural and urban areas. At the National level, 1.6 percent of live births have been reported within an interval of one year for rural and 1.1 percent in urban areas. The data reveals that so far as spacing of children is considered, there is marginal difference between the rural and urban areas indicate that about half of the birth have spacing 36 months and above in urban compared to about two fifth in rural areas. More than 70 percent of births have birth interval of 24 and more months both in rural and urban areas.

Statement 39

Percentage distribution of second and higher order live births by interval and residence, India and bigger States, 2012

Medical attention at delivery

3.36 While recording details of every outcome of pregnancy during continuous enumeration and half yearly survey, the enumerators and supervisors are required to enquire about the type of medical attention received by the mother at the time of delivery/abortion of the new born. In the new sample from 2004, the options on types of medical attention received by the mother at delivery have been modified to capture the deliveries specifically at private hospital/nursing homes. The new options include 'Government Hospital', 'Private Hospital', 'Qualified professional', 'Untrained functionary and others' in comparison to 'Institutional'; 'Doctor, Nurse or trained midwife'; 'Traditional birth attendants'; and 'relatives or others' adopted in 1991 SRS sample. Statement 40 below gives the percentage distribution of live births recorded in the year 2012 by type of medical attention received by the mother at the time of delivery for India and bigger States separately by rural and urban areas. At the National level, 49.3 per cent births were attended by Government Hospitals and vary from 47.7 per cent in rural areas to 54.9 per cent in urban areas. Among the bigger States, it varies from 29.2 per cent in Jharkhand to 66.4 per cent in Rajasthan. About 23.8 per cent of birth occurred at Private Hospital. Medical attention by qualified professionals constitutes 12.4 per cent of total delivery whereas untrained and others constitute 16.6 per cent. More than three fourth of deliveries are occurring in institutions and conducted by the qualified professional.

Statement 40

Percent distribution of live births by type of medical attention received by the mother at delivery by residence, India and bigger States, 2012

CHAPTER – 4

ESTIMATES OF MORTALITY INDICATORS

Mortality is one of the basic components of population change and related data is essential for demographic studies and public health administration. It is the principal ingredient for population projections and life tables. Information on death events recorded in SRS is used to estimate mortality indicators. The various measures of mortality published under SRS are Crude Death Rate (CDR), Under-five Mortality Rate (U5MR), Infant Mortality Rate (IMR) and its components, Age Specific Mortality Rates (ASMR), Still Birth Rate (SBR) and Peri-Natal Mortality Rate (PMR).

4.2 SRS has continued to provide data for estimating various mortality measures since its inception. The crude death rate at all India level has declined significantly from 14.9 to 12.5 during 1971 to 1981 and thereafter from 9.8 to 7.0 during 1991 to 2012. The decline has been steeper in rural areas as compared to urban areas. The infant mortality rate, which plays an important role in health planning, has shown a considerable decline from 129 per 1000 live births in 1971 to 110 in 1981 and from 80 in 1991 to 42 in 2012. The child mortality rate has depicted a perceptible decline from 51.9 in 1971 to 41.2 in 1981 and from 26.5 in 1991 to 11.5 in 2012. In 2012, about 34.6 percent of the deaths were institutional and 65.5 percent received medical attention other than institution.

4.3 Apart from the all India scenario, this chapter presents data on mortality indicators for bigger States by sex, residence and broad age groups. Besides Under-five mortality rate, it includes data on infant mortality and its component viz., neo-natal mortality and post neo-natal, peri-natal mortality and their changes over the last decade. It also includes data on medical attention before death. Chart 18 depicts crude death rate by residence, India and bigger States, 2012.

4.4 Apart from the mortality indicators at State and National levels, this report also includes estimates of death rates at sub-State, viz. NSS Natural Division Level in rural areas. The Table 11 in the annexure to this report contains data on death rate and infant mortality rate besides birth rate for 56 Natural Divisions of 16 bigger States. The Table 11 also contains data on death rate and infant mortality rate besides birth rate for four metro cities viz. Chennai, Delhi, Kolkata and Mumbai.

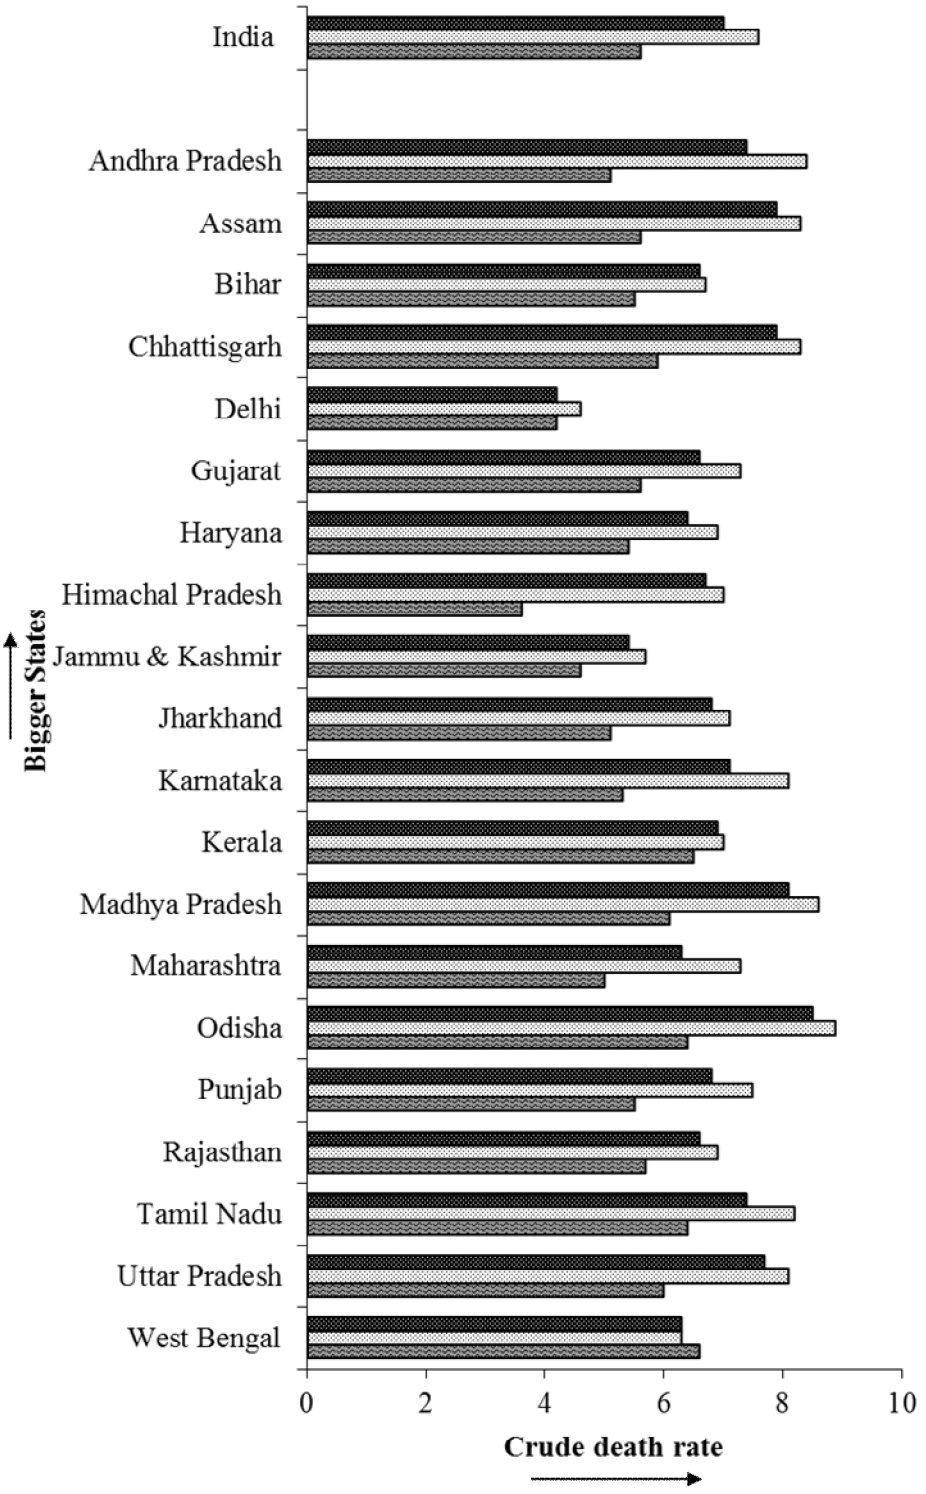

4.5 Crude Death Rate (Statement 41) at the National level for 2012 is 7.0 per thousand population and it varies from 7.6 in rural areas to 5.6 in urban areas. Among the bigger States, it varies from 4.2 in Delhi to 8.5 in Odisha. The States having death rate higher than or equal to the National level are Andhra Pradesh (7.4), Assam (7.9), Chhattisgarh (7.9), Karnataka (7.1), Madhya Pradesh (8.1), Odisha (8.5), Uttar Pradesh (7.7) and Tamil Nadu (7.4). Distribution of bigger States by level of CDR in rural and urban areas is shown in Chart 19. The estimated age-specific death rate by sex and residence for India and bigger States has been detailed in Table 8.

Statement 41

CDR (Crude death rates) by residence, India and bigger States, 2012

Chart 18: Crude death rate by residence, India and bigger States, 2012

4.6 Statement 42 given below shows the percentage change in the level of Crude Death Rate between the period 2000-02 and 2010-12 for India and bigger States. During this period CDR in India has declined by 14.6 per cent. Among the bigger States, decline in CDR varies from 22.2 per cent in Uttar Pradesh to 3.8 per cent in Tamil Nadu. In Kerala, average CDR have shown marginal increase during 2000-02 to 2010-12 period, which could be possibly due to the changes in age structure of the population.

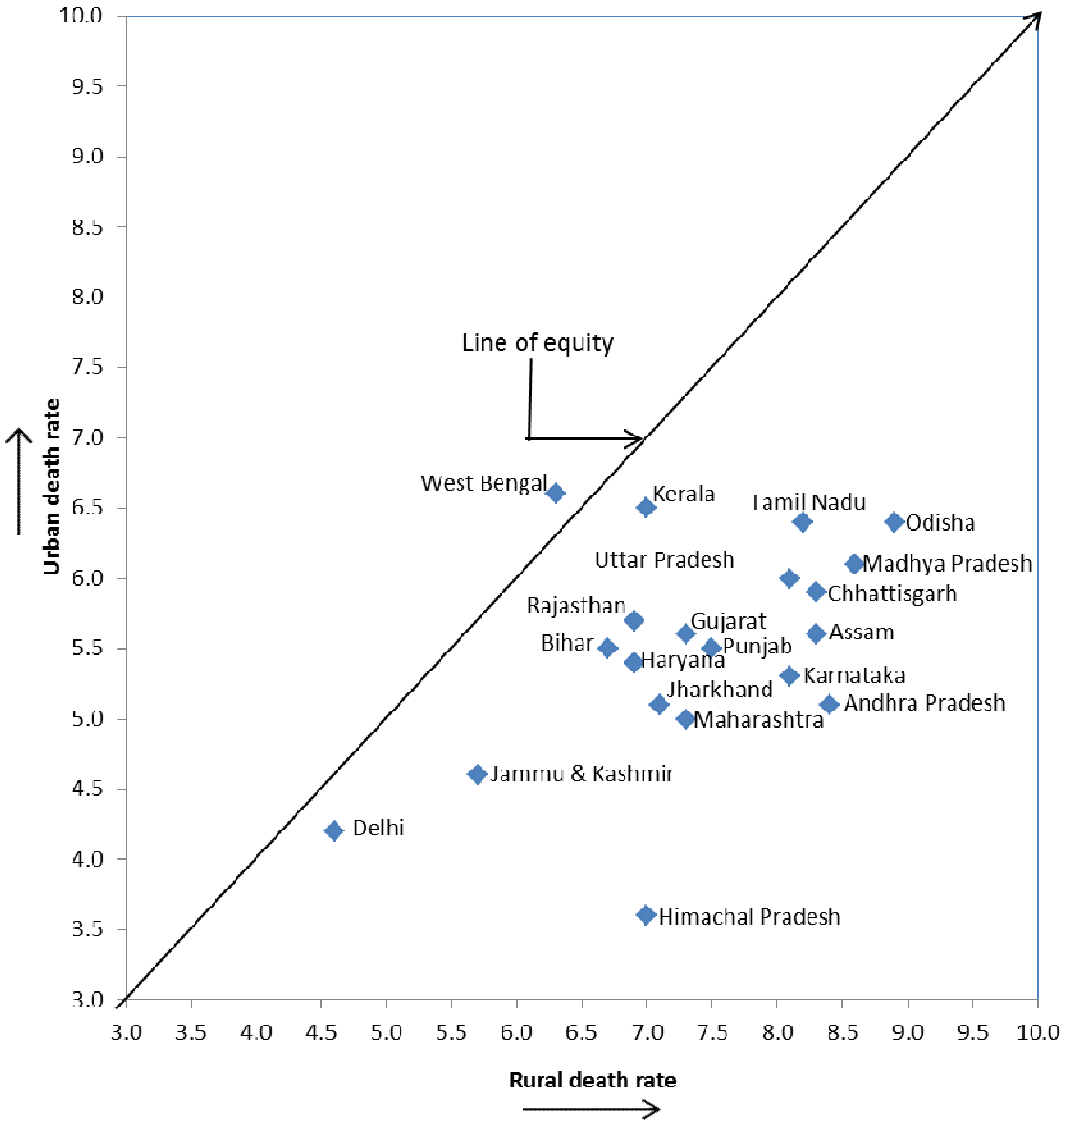

Statement 42

Percent change in average Crude Death Rate between 2000-02 and 2010-2012, by residence, India and bigger States

India and bigger States	Total			Rural			Urban		
	2000-02	2010-12	% Change	2000-02	2010-12	% Change	2000-02	2010-12	% Change

4.9 Statement 45 given below provides the per cent distribution of deaths by broad age groups for India and bigger States. At the National level, 13.0 per cent of the deaths are of infant deaths (<1 year) whereas 51.4 percent of the deaths pertain to persons aged 60 years and above. Toddlers (1-4 years) accounts for 2.8 per cent of the deaths. The percentage of infant deaths to total deaths varies from a low 2.5 per cent in Kerala to a high of 19.2 per cent in Rajasthan. Percentage contribution of deaths from person's 60 years and above varies from 39.9 in Assam to 74.2 in Kerala. The percentage distribution of deaths to total deaths, by residence, sex and age-group at the National level and for the bigger States are given in Table 10.

Statement 45

Per cent distribution of deaths by broad age groups, India and bigger States, 2012

India and bigger States	Broad age-groups					
	<1	1-4	0-4	5-14	15-59	60+

Note: Total may not add upto 100 due to rounding off.

4.10 The percentage share of infant deaths to total deaths by residence is shown below in Statement 46 for India and bigger States. At the National level, such share in the year 2012 is 13.0 per cent and varies from 14.2 per cent in rural areas to 8.6 per cent in urban areas. In rural areas, Kerala registered 2.7, the lowest per cent share of infant deaths as compared to 21.1 in Rajasthan. In urban areas, the variation is from 2.0 per cent in Kerala to 15.3 per cent in Uttar Pradesh.

Statement 46

Percentage of Infant deaths to total deaths by residence
India and bigger States, 2012

4.11 Statement 47 given below presents Infant Mortality Rate (IMR) by sex and residence for the year 2012 for India and bigger States. Infant Mortality Rate is defined as the infant deaths (less than one year) per thousand live births. At the National level, IMR is reported to be 42 and varies from 46 in rural areas to 28 in urban areas. Among the bigger States, it varies from 12 in Kerala to 56 in Madhya Pradesh. Female infants experienced a higher mortality than male infants in all States. Chart 20 provides the values of IMR by residence for India and bigger States. Distribution of bigger States by level of IMR in rural and urban areas is shown in Chart 21. The estimates on child and infant mortality indicators by residence have been detailed in Table 9.

Chart 20: Infant mortality rate by residence, India and bigger States, 2012

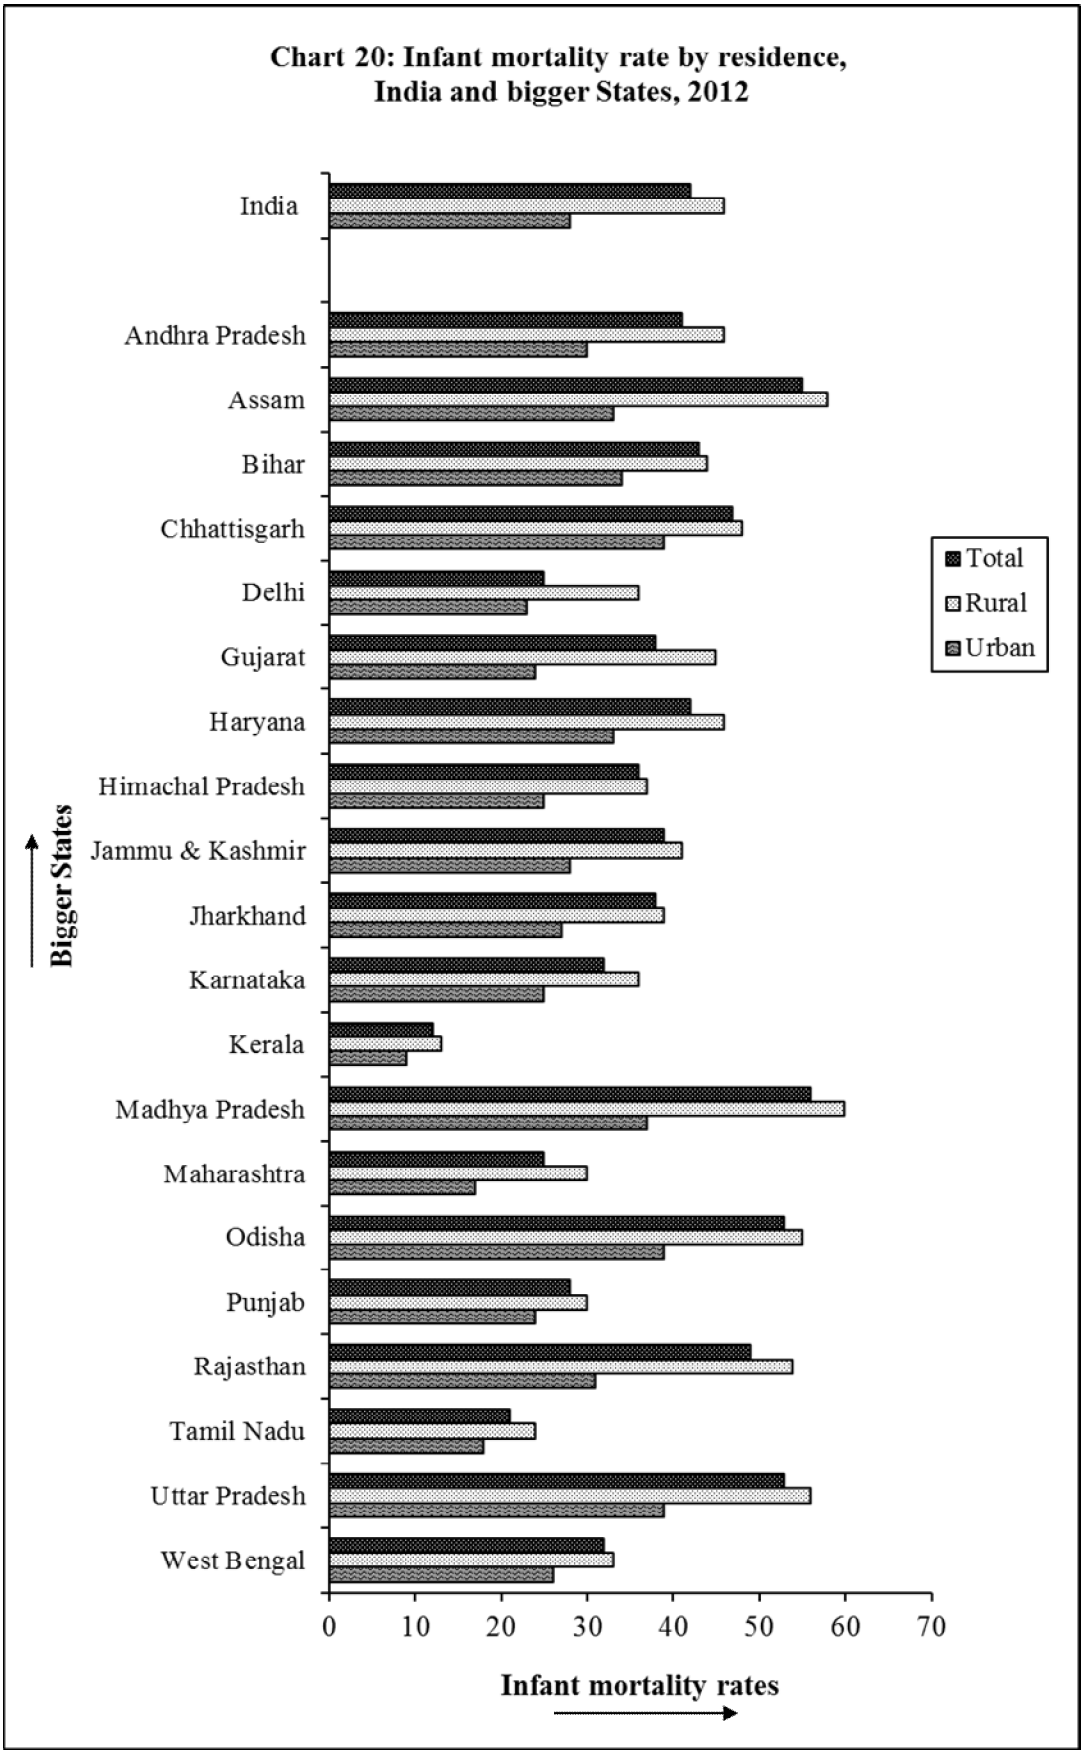

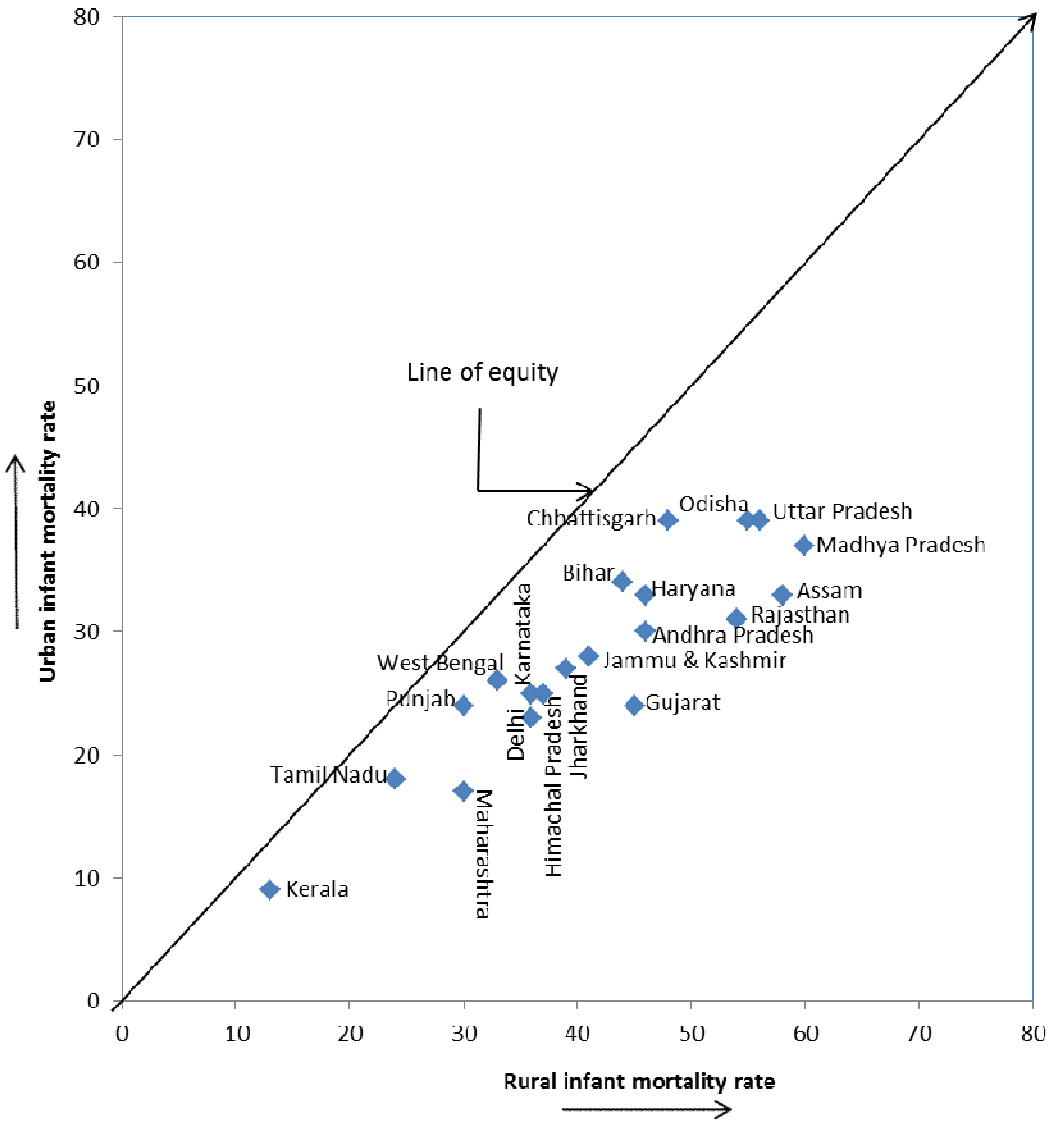

Chart 21: Distribution of bigger states by Infant mortality rate for rural and urban areas, 2012

4.12 The percentage change in the average level of infant mortality between 2000-02 and 2010-12 is given below in Statement 48. During this period, IMR, at the National level, declined by 32.2 per cent. Among the bigger States, the decline varies from 53.4 per cent in Tamil Nadu to 22.9 per cent in Assam. In the rural areas, decline in IMR varies from 54.3 per cent in Tamil Nadu to 22.7 per cent in Assam. The decline in IMR varies from 44.9 per cent in Rajasthan to 3.8 per cent in urban areas of Assam. IMR in rural area of kerala and urban areas of Karnataka have shown an increase, which may be attributed to sampling fluctuation.

4.13 Statement 49 given below presents the neo-natal (less than 29 days) mortality rate and the percentage of neo-natal deaths to infant deaths for the year 2012 both at the National and State levels. At the National level, the neo-natal mortality rate is 29 and ranges from 16 in urban areas to 33 in rural areas. Among the bigger States, neo-natal mortality ranges from 39 in Madhya Pradesh and Odisha to 7 in Kerala. The percentage of neo-natal deaths to total infant deaths is 68.5 per cent at the National level and varies from 56.8 per cent in urban areas to 70.4 per cent in rural areas. Among the bigger States, Jammu & Kashmir (77.2) registered the highest percentage of neo-natal deaths to infant deaths and the lowest in Assam (52.1).

Statement 49

Neo-natal mortality rates and percentage share of Neo-natal deaths to Infant deaths by residence, India and bigger States, 2012

India and Bigger States	Neo-natal mortality rate			Percentage of Neo-natal death to Infant deaths		
	Total	Rural	Urban	Total	Rural	Urban

West Bengal	22	23	16	67.6	68.7	62.1

4.14 Early neo-natal mortality rate i.e. number of infant deaths less than seven days of life per thousand live births forms an important component of infant mortality rate and more specifically of the neo-natal mortality rate. Statement 50 given below presents the early neo-natal mortality rate along with the percentage of early neo-natal deaths to the total infant deaths. At the National level, the early neo-natal mortality rate for the year 2012 has been estimated at 23 and ranges from 25 in rural areas to 12 in urban areas. Among the bigger States, Kerala (4) and Madhya Pradesh & Odisha with 29 are the two extremes. The percentage of early neo-natal deaths to the total infant deaths during the year 2012, at the National level, has been 53.3 and it varies from 55.0 in rural area to 42.9 in urban areas. In most of the States, rural proportion is relatively higher than the urban proportion except for Himachal Pradesh, Punjab, Delhi, Gujarat and Chhattisgarh. Among the bigger States the percentage for total, varies from 38.0 in Kerala to 62.5 in Karnataka.

Statement 50

Early neo-natal mortality rates and percentage share of Early neo-natal deaths to Infant deaths by residence, India and bigger States, 2012

India and Bigger States	Early neo-natal mortality rate			Percentage of Early neo-natal deaths to Infant deaths

4.15 Statement 51 given below presents the peri-natal mortality rate and still birth rate for the year 2012, by residence, for India and bigger States. Peri-natal mortality rate (PMR) is defined as the number of still births and infant deaths of less than 7 days per one thousand live births (LB) and still births (SB) taken together during the year. The still birth rate (SBR) is estimated as the ratio of the number of still births per one thousand live births (LB) and still births (SB) during the year. At the National level, peri-natal mortality rate has been estimated to be 28 and ranges from 31 in rural areas to 17 in urban areas. Among the bigger States, Kerala (10) and Odisha (37) are the two extremes. The estimate of still birth rate for the year 2012, at the National level is 5. Among the bigger States, the highest level of still birth rate has been estimated for Karnataka (14) and the lowest for Bihar and Jharkhand (1). Still births are extremely difficult to capture and there is a room for considerable improvement in netting the events.

Statement 51

Medical attention before death

4.22 The type of medical attention received before death is also collected in the SRS. In the new sample from 2004, the options on types of medical attention received before death have been modified to capture the deaths occurred specifically at private hospital/nursing homes. The options include 'Government Hospital', 'Private Hospital', 'Qualified professional', 'Untrained functionary' and 'others'. The options for the sample based on 1991 sample were 'Institutional'; 'Medical attentions other than institution'; and 'No medical attention'**.** Statement 58 given below presents the percentage distribution of deaths by type of medical attention received before death for India and bigger States separately for rural and urban areas for the year 2012. At the National level, 22.0 per cent of the deaths occurred at Government Hospital and varies from 19.8 per cent in rural areas to 29.9 per cent in urban areas. Among the bigger States, Himachal Pradesh (48.3) has the highest percentage of deaths in Government Hospital and Jharkhand (12.9) the lowest. Deaths in private hospitals account for 12.6 per cent and it varies from 3.9 per cent in Odisha to 33.9 per cent in Kerala. About 27.8 per cent deaths were attended by untrained functionaries and others.
